Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

I have the cones from a 2M AEA ISOPOLE antenna and I am tryig to find
information on how to fabricate the upper radiator. One thought was to
use a mobile 5/8 antenna that screws onto a UHF connector. slot the
end of the mast so it can be clamped to the connector with a hose
clamp and then mountthe cones per the AEA assemblyinstructions. My
first attempt to do this was a failure but the old antenna I used may
have been  bad. Before I throw good money after bad I was wonderig if
this should have worked.

Jimmie

I put up a 20 meter dipole array a while back and I don't seem to be receiving the greatest signals. The height is fairly low, about 20', and one part of the array is fairly close to an aluminum fence I have surrounding the property. I'd say the southern leg of the array is about 25' away from the fence. So I ask the question: what effect can fences have on antennas and what are some possible solutions? I can rule out moving the antenna because I lack the room to move it any further away from the fence.

Thanks,
Bill

Since length formulas treat your installation as being close to ideal, consider that the antenna, being physically lower than ideal, may be too long for 20m work. I made that mistake with a 40m dipole some years ago and had to cut it shorter to reach resonance, due to the effect of the too-nearby earth. (A tuner makes your radio happy but won't solve inherent problems.

If the the antenna sees that chunk of metal fence as an upward extension of ground, that just adds to your problem, although 25' away doesn't sound like a big deal.

Have you access to an antenna analyzer that will clue you to the resonant frequency of your dipole?

Know also: being too close to ground will cause the pickup pattern to favor upward, vice off toward the horizon

-

For clarification, is the "dipole array" more than one dipole?

You could configure a reference antenna by mounting a nominal 16 foot vertical element on the fence, using the fence as a ground. (If you don't have spare tubing, a wire taped to a bamboo pole would do) Then you could get an idea of whether or not the dipole is working OK, or the band being dead.

This works fairly well in my experience.

I have a Gap vertical with the feed 8 feet above ground and a 40 or so foot dipole at about 27 feet. Both connect to an LDG AT100Pro. The Gap needs virtually no matching and on 20 the dipole doesn't need a large amount. RG213 at about 70 feet on each.

It is interesting to compare the two. It also makes one understand why diversity receive antennas are really nice.

By and large the receive signal strength is close, which makes sense given how the new wonder digital S meters work. Transmitting to ground wave stations is as expected (again obviously roughly) when considering horizontal v vertical.

The holy goal of resonance has little to do with the performance of a plain 0.5 WL dipole. Almost all of the power delivered will be radiated. What is sure to reduce performance of a 20 meter dipole is being only 6 meters above ground. 6 meters is about 0.28 WL and thus most of the radiation is towards the zenith. This will be true even if you prune the length of the antenna to have no reactance (to be resonant) at your operating frequency.

The old tale of resonance equating to enhanced performance is, to say the least, an exaggeration.

We do not know how high the fence is nor what sort of grid it has. Since the antenna can not be moved horizontally, not much point in speculating about the effect of the fence.

What will improve performance is to move the dipole higher.

Since length formulas treat your installation as being close to ideal, consider that the antenna, being physically lower than ideal, may be too long for 20m work. I made that mistake with a 40m dipole some years ago and had to cut it shorter to reach resonance, due to the effect of the too-nearby earth. (A tuner makes your radio happy but won't solve inherent problems.

If the the antenna sees that chunk of metal fence as an upward extension of ground, that just adds to your problem, although 25' away doesn't sound like a big deal.

Have you access to an antenna analyzer that will clue you to the resonant frequency of your dipole?

Know also: being too close to ground will cause the pickup pattern to favor upward, vice off toward the horizon

At 20' AGL I'd be using a full wave horizontal loop for receiving. I
transmit with a vertical and use a loop plus the vertical (via MFJ-1026)
for receive. for receive

AT 20 ft above ground the antenna may be performing more like an NVIS
antenna radiating most of the signal upwards. Unfortunately 20M is not
a great NVIS band.

FWIW I have a cell tower about 100ft away with an 'if' at 144.000Mhz and
can hear what are probably many conversations going on at once. The
cell operators couldn't care less that it makes the bottom of the band
unusable for me !

Radio Frequency, a electro magnetic field from 3khz to 300ghz.

This RF is a specific freq? RF could just be a general statement, meaning anything RF. So if your voice is about 10000 to 20,000 hz to which then dogs pick up just higher,

RF ?? What a broad statement.

So what about the batteries? Anyone got success or bad luck with a online dealer? I see them on ebay for about 40 bucks, shipped, seems about fair for a 12v.

So, if the feed point impedance was 18-j142, and you used 38' of RG58 (for example, I could not find that info), then you would expect to lose 70% of the power out of the ATU as heat. Of course, it is likely that the power out of the ATU is somewhat less than the transmitter output as the ATU load is some 7+j10, relatively low R (but typical ATUs tend to be more efficient on the higher bands).

Did the Smith chart reveal any of that?

Owen

How were you able to obtain an amateur radio license without knowing the
difference between acoustic energy and electromagnetic energy?

Anyone who thinks he's picking up radiation from rocks on his HT probably
shouldn't be messing around with batteries, it might be a bit over your
head.

Is it Nylon or Dacron? Anyway, I just tie knots in mine.

As long as you don't put your ham station next to your Smartmeter, you'll be OK. If you get the battery from a Vertec industrial supplier it's cheaper than from a ham radio supplier, so I'm told. Please let us know, thanks.

dBi is a trick. Subtract 2.5 from the gain figure. Also, I think the OP
antenna was an omni, the panel antenna is directional.

There are loss scales at the bottom of the Smith chart that allow
losses to be included. That's why I mentioned "tuner efficiency"
and "considerable feedline losses" in my posting.

Yes, Thanks for the info

Yes, rocks do emit radiation, especially if they come out of the deep
ground.

As a matter of fact, at our international boarders, when there is a truck
load shippment of granite countertops coming through, their x-ray machines
cannot scan those trucks because of that natural radiation coming from those
rocks so contrar to what you may believe, rocks do emit radiation.

The smart meters do emit a massive amout of RF now that I have learned and
it is a big problem in some states like California where groups are now
rising against it. Because of it.

While today we micro manage our health in so many ways, I like to refine
where I can. Yes, I know some old hams who worked next to 2kw linear amps
their whole life, nothing wrong with them, however I am curious to learn.

Hi David

I wasn't really asking about acoustic energy, I was asking about RF energy, frequency, radio frequency. Not sure where you came up with your assumption.

Of course I asked the question, which means I didn't know.

I hope you are not a teacher, I would be an angry taxpayer in your community.

Why not just use the same system used on tents that use rain fly covers?
Not sure how to describe it but you can find them on almost any light weight tent.
Just use a bigger version.
Most use light aluminum but heavy Plexiglas or Lexan would work just fine.

> Did the Smith chart reveal any of that?

Well, subject to how carefully you plotted the data, you might get a reasonable answer for the line input impedance (as seen by the ATU), but the Smith chart will not directly read the line loss with a mismatched losd.

With a lot of care in plotting, you might scale off the values of G at line input and output, and find the ratio Vload/Vin from the chart to calculate the ratio of Pload/Pin and so find the loss under mismatched load.

The line loss in this case is just over 5dB, more than 10 times the 0.5dB loss you would observe with a matched load.

An exercise for the reader is to use a Smith chart to find the loss under the mismatched load with RG213 where the matched line loss is about 0.31dB.

Owen

PS: if you had in mind using the handy dandy "Additional loss due to VSWR" graph in the ARRL, the line input VSWR is 7.7, load VSWR is 23.7. If you get the same loss figure are mentioned above, it is by accident of the scenario rather than soundness of the method.

Here's a fancy version
http://www.niteize.com/collections/figure-9

I've seen ones that are basically steel wire bent into an appropriate
shape, and, of course, the 3 hole toggle kind: like these
http://www.campmor.com/line-tighteners-2.shtml   8 for $2

The steel wire ones are basically a ring on one end, and a sort of
dual slot thing, hard to describe in words.  Functionally identical to
the campmor ones.

And, there's another scheme with two overlapped rings, like you use
for tightening a strap or buckle.

Owen, I respect your obvious technical ability and the only time I
ever disagree with you is when you go off the deep end and accuse me
of saying things that I never said and/or try to pick a fight like you
are trying to do on this thread. What in the world do you expect to
gain from such antisocial behavior?

I think that losses were discussed on a previous iteration of the thread,
and I have no quarrel with the loss numbers.

Many years ago, I might have been able to somehow deduce cable losses from a
Smith chart, but nowadays I just use the published curves.

The current configuration (14.6 ft vertical) is promising for 14-28 MHz
operation, as three of the bands have SWRs of less than about 10:1, and the
other two are below about 20:1. The antenna is not checked out on all of
those bands, but it does an acceptable job on 12 and 10 meters where the SWR
is highest. That statement should not be construed as meaning that it is
the final configuration.

>are you happy with the way the radio works? Does it work as specified on both UHF and VHF?

As he didn't answer here, I'm guessing it was just a spam post, but I did buy an FD-880 and will give you my impressions of it.

It is a very solidly built radio, compact and with a great feel to it. It has 128 memories, but they are not divided into any banks, nor are any specific to either band. It's a little inconvenient, but I've programmed mine to alternate between VHF and UHF frequencies - ie, all odd number memory channels are VHF, while all the even number ones are programmed with UHF frequencies so I don't have to spin the dial too many times to access one or the other bands in memory if I had kept them all together. There is a programming cable and software available for it.

A number of people I have talked to on it are surprised at the sound quality as well as the signal strength. My FD-880 measures 5 watts on high power into a dummy load. The receive audio is outstanding. Clear and very loud when turned up just half way.
Programming takes a little getting used to, but isn't that the case with any radio? Anyway, once you've gotten used to it, it's a snap.
There are 2 features I don't have much use for, but I'll mention them anyway. That's the FM radio, (the 76 to 108 MHz broadcast variety) and stopwatch functions. The FM radio works, but that's about the best I can say for it. You can program 9 or 10 stations into their own memory locations to be recalled at any time. If you are listening to the radio, and a call comes over the VHF or UHF frequency set, the FM radio function will be interrupted so you can hear the programmed frequency.
The stopwatch - the best thing about the stopwatch is that it can be disabled in the menu! ;-) Using the stopwatch disables the transmit and receive functions.
This radio is well worth every penny paid for it, and I wouldn't hesitate to buy another.

Cons - yes, there are a few, but in my opinion, minor.
The "meter" bar shows full scale on any received signal - or more accurately, it is only an indication that the squelch is open, not of signal strength.

I read, (and have confirmed) that the DTMF tones are coupled to the transmit audio via the mic from the sound from the speaker. This means that if you have headphones on, the DTMF tones can not be transmitted because the mic can not hear them. Same holds true if you simply have the volume turned down all the way. It they don't come out of the speaker, the mic can not pick them up to transmit them.

The only way to charge the batteries is when they are attached to the radio. When you plug in the charger, it powers the radio up, even though the radio is turned off. It bypasses the on/off switch when charging, but seeing as the power switch is part of the volume control, at least it's turned all the way down when charging. The only sound you can hear is when the squelch, (for which there is no control except in the menu) opens and closes, it makes a click or pop sound from the speaker.

Weird, but I guess that's why it cost me less than $100.00 US even with a spare battery and shipping included.

That's all that comes to mind at the moment. I hope it helps. I really do like this radio. My HTX-204 is a better radio, but I grab the FD-880 when I go anywhere. That should tell you a lot.

An email correspondent suggested the radially scaled "SW LOSS COEFF" gives a direct reading loss under mismatch from the chart.

There are assumptions that underly that scale, pre-requisites if you like for it to be accurate. They are explained in Smith's book: "If a waveguide is one or more wavelengths long, the average increase in dissipative loss due to standing waves in a region extending plus or minus one-half wavelength from the point of observation may be expressed as a coefficient or factor of the one-way transmission loss per unit length".

So, it does not apply to a feed line of less than a full wave, or any residual of less than a full a wave after working out the additional loss in each of the full wave segments of a line. It is tedious and accurate only for lines of integral full waves length.

The potential error applying it to arbitrary line length ranges from insignificant to huge.

The graphs in the ARRL suffer the same problem, and IIRC they do not state the assumptions.

The Smith chart solution I described in my earlier post works for arbitrary line lengths, and properly reveals the cases where loss under standing waves is less than matched line loss. TLLC (http://www.vk1od.net/calc/tl/tllc.php) also calculates the loss correctly for arbitrary line lengths.

Owen

The beverage antenna seems to be an excellent mw receiving antenna.

1) Is there a reasonable minimum length?

2) The beveage is supposed to be grounded through a resistor at the far end. What type of resistor and how much ohmage?

Padraigh ProAmerica wrote:

> end. What type of resistor and how much ohmage?

There are several antenna books which make the same suggestion, so I have
no way of citing the original source.

They all sugest you take a mechanical hour timer and connect a terminating
potentiomiter to the shaft of the timer, start the timer and record the
noise from the antenna. Note where it reaches the minimum.

A more modern possibility is to use two HT's and have one person monitor the
noise, while the other adjusts the resistance.

You probably could do it with a laptop, wifi and skype, but that may affect
the results.

Geoff.

The answers to all your questions and some you haven't thought of are
answered in ON4UN's book: Low-band DXing. See ARRL for the book. Great
reading any time.

David

Are you a licenced Ham Radio operator? I mean have you written the examinations held by an accredited outfit worthy of providing you with a certificate? I have. Enough said there because your childish mud flinging means nothing.

I asked a question, means I wanted to learn somethings, and this group has a lot of knowledge in it and is a wonderful resource. I guess my next question is how to block out the trolls, the wanna bees.

I reiterate my statement, I hope you are not a teacher, very poor teaching skills. I can almost predict with great certainty that you are not a teacher. None of your advice or comments were constructive, or informatonal or helpful. None.

I wouldn't even want you as an employee, with that negative do nothing, add no value attitude, wow, I wouldn't even want to work beside you.

However, without knowing you I can estimate you have more knowledge about electrons, protons, rayons and electronic circuitry than I do. I will give you that David, however I can bet you dollar to donut that my list of credentials is far longer than yours, so while I may be more versed in a wider range of knowledge, yours is specific to your hobby. Or maybe a profession for you, obviously you are completely knowledgable about electronics. Completely. Not me, I have a base knowledge of electronics, enough to keep me happy and do what I want to do with electronics like building my own antennas and so forth, just the basics. I would need help to repair a rig if it fried. Unless is was an older rig, then I could probably repair, but I am sure you could repair even the latest advancements in our technological world.

I haven't paid anyone to teach me about RF, so no need to "go back and get my money back" so your insults at my teachers holds no water. Not sure why you would even say such a thing.

I mean I asked a question about RF and you answered by saying "Perhaps you should go back to whoever taught you about RF and get your money back then". See, I can parse you also.

That is why I said, "I hope you are not a teacher, I would be a upset taxpayer in that community". Because if you are a teacher and the student asks you a question, lol,,, o my,,,

Are you the ham who complained about me fixing my own furnace not long ago? While I don't have a certificate there either however 10 years ago I installed it myself, now I needing to replace or fix some parts, but you said "Hire a qualified, certified technician". So I did, paid him to diagnose the problem, he said it was the fan relay board, I bought a new board from a friend, replaced it and exact problem remained. Turned out to be the reset button on the high temperature limit switch control. I didn't know there was a reset button and your qualified certified technician didn't know it also.

Are you the same chap who said to me that rocks don't emit radiaton? Well in fact they do, they do so much to a degree that it is a well known fact, while I am not sure if it is gamma, alpha, etc etc or what, but I know they do. Because you said " Anyone who thinks he's picking up radiation from rocks on his HT
> probably shouldn't be messing around with batteries, it might be a bit
> over your head.""

That is what you said David, and you were wrong, because all rocks coming out of the ground do emit certain forms of radiation, I recommend you google that. There you go David, you are not as smart as you set yourself out to be.

Anyway, great group here, lots of knowledge of wide range of knowledge and I will certainly ask future questions of this group, lots of knowledge here and most appreciate all the help I have received, as I am simply interested in learning, love learning, love learning new things and doing things myself.

In the future David, if you see my post, asking a question that you have a wealth of knowledge, instead of trying to make me look even dumber, or trying to make you look even so much smarter than me, just ignore my post. I suppose the proper thing to do is to add you to some kind of a filter on this newsgroup, I suppose I could filter you out because I don't believe you have added any value to any of my question, only critical of my level of knowledge and critical of my teachers. So David, just ignore post made by me if you don't mind. I have never filtered out people yet on here, I don't filter out those smut slut advertisements, I just ignore them, I suppose I could if I had to filter out both David and the Smut and Slut Advertisments, but would rather you just ignore them. I suppose I could ignore your post also David, your post have never, ever added any value that I have seen, so I suppose I should just ignore them. I wont be trapped into any more of your mud flinging games, I suppose it is just a bait and trap for you David. But good luck with your wealth of knowledge, I hope you use it in a good way.

Thanks again all for your answering my questions, truly appreciate it.

73

My god, what arrogance!

Perhaps you should go back and re-read your initial post; it was totally incoherent and laughable, and you now have the temerity to criticise people who comment on that.

What are 'rayons' by the way; more modern nylons?

Jeff

Hi Jeff

Thanks for the flowers.

I guess you also are another add on to some kind of a kill file filter list.

I am going to have to learn about how to filter out what you don't want and leave open what I do want.

Why would posters want to come back with negative mud flinging when someone obviously hasn't the knowledge and so asks a question.

Did I say that properly Jeff? Did you understand it? Was it coherent or laughable?

Just because some of you people have more knowledge in something than I, and then when someone asks you a question about that topic, you feel the need to enforce that fact that you do have more knowledge in that topic I asked about. Then you rub it in, and grind the student (or one asking the question). Just because it is so obvious to you, after your years learning the topic in whatever school and you are well versed in the topic, wow, that gives you the right to hammer down on someone who hasn't the level of knowledge in that topic. You think because you are confident in a topic that only an ignorant person would ask about that topic, so you must enforce that fact that the person is ignorant in that topic.

Did I say that properly Jeff? Did you understand it? Was it coherent or laughable? lol,,,

Wow, what happened to the Hams I know? I been around for a while and know many many awsome hams, great people, and a lot of the most intelligent people I know. I guess just like the education system, when you lower the bar, this is what you get. The Jeffs, The Davids, the Einstiens who are smarter than everyone. lol,,, Did I say that properly Jeff? Did you understand it? Was it coherent or laughable?

Come on Jeff, back to you,

Your first post there was pretty dramatic, pretty theatrical, but had nothing, I repeat, nothing to do with my question. Why respond to my question when your answer had nothing to do with the question?

Did I say that properly Jeff? Did you understand it? Was it coherent or laughable?? lol,,, Come on Jeff,, you are just baiting me now, nobody can be that ignorant. Nobody.

Anyway, I will learn how to use my filter on this News group,,, it seems there are a few trouble makers within the masses. Please from now on, when I ask a question, and I will, about something you are professor of world knowledge on that topic, 1st in your class, top of the crop, world master in the topic, please don't bash me because I am not knowledgable about that topic. THAT IS WHY I ASKED!!!!

I hope you Jeff and David are not teachers, otherwise I would be an upset taxpayer in your community.

Anyway, ya, I will just filter out the riff raff because when I ask a question from this group, off topic or otherwise, I am thankful for all the intellegent responses. Most thankful. I guess you get some bad with the good. But don't criticize me because I don't have the same level of knowledge as yourself on a certain topic, that is why I asked. And please forgive all your students who don't have the same level of knowledge as yourself (if you are a teacher). I hope you are not actually, but some advice from a life time learner, don't bash your students just because they came to you to learn, that is unprofessional.

And Jeff, you asked what a Rayon was, it is an improved version of certain fibers, like a silk, or man made fiber. I am not sure if it is used for nylons. Maybe.

Anyway, thanks for responding, thanks for coming out.

73

He doesn't have one. He claims to be licensed, but it's obvious he isn't.
Just read what he writes above, and in his other posts. There is no way this
guy is licensed.

Are you kidding me?

Why would I ask about batteries for my FT530 ? Duh!!!!

I know, I know, I do use it for communication with my boat from land, I do enjoy using it for marine band use also.

Why would I ask a question about clamping my satelite dish onto my self supporting tower? I was curioius about gnding there as it isn't actually yet.

Why would I ask a question about my Sauna after I built it? I mean only a Ham would design, build their own sauna.
Why would I ask a question about my furnace? I mean only a Ham would completely install their own high efficient furnace.
Why would I have been a long time lerker in this news group?

Are you sure you are a ham? I mean if you are simply a 2m appliance operator simply always talking about their ailments, well that is my best guess. But you know, I don't actually believe you are a licennsed ham. Maybe a novice, or beginner, or CBer. Ya, I think you are a CBer. Seems your style.

To the chap who said about me "He doesn't have one, he claims to be licensed, but it's obvious he isn't. There is NO WAY this guy is licensed"

To this chap, would you care to put your money where your mouth is?

Be a man, or I bet you are one of those CBers who hangs around on Channel 19 badmouthing the truckers.

So, do you care to or not?

Nuff said., I didn't think you would, but I am willing to put up say,,,, 1g ,,,,

hmmmmm , I didn't think so,,,,,

anyway, you guys are just baiting me, you are poking sticks at me and hiding in the comfort behind your microphone,,, typical CBer tactic. Na,,, not my style.

What did they call you guys on the CB again,,, I forget,,, were you CB Heros?

Jeff and David,, lol,,, Breaker Breaker 19,,, any truckers out there? ,,,, lol,,,,

Ya, I know you are baiting and playing with me now,,, It is ok boys,,, but really, get your licenses,, the ham bands are much more interesting than the CB bands.

But if that is your level then good for you and be the best you can be.

73

When I was in the Air Force we had some that didnt look too far away
from a dog bone insulator if you use your imagination a bit. I made
some for tarp tie downs by welding some nuts on the the end of some
steel rods. The threads in the nuts gave it a really good grip.

Look at a tautline hitch on google. Used to adjust tent ropes and such

Hi again,

I am sorry for stirring up a hornets nest here, I didn't expect some of the negative comments, maybe I will try answering my own question through google,

Do rocks give off radiaton,

Certainly they do, to whoever it was who suggested I was ignorant or should not work with batteries because I asked the question, I wanted to know the type of radiation, level of harm, especially on my sauna rocks, well the answer is yes.

http://wiki.answers.com/Q/Do_rocks_give_off_radiation

http://www.epa.gov/radiation/radionuclides/radium.html

http://en.wikipedia.org/wiki/Gamma_ray_logging

http://wiki.answers.com/Q/Do_rocks_give_off_radiation

http://www.furryelephant.com/content/radioactivity/background-radiation/

http://www-formal.stanford.edu/jmc/progress/radiation.html

Second part of my own question was about my new smart meter they put on my home. My FT530 goes off the chart when I am near it, I asked why and if the radiation or RF from there was serious. I will answer my own question through google.

Yes, Smart meters give off a lot of radiation and it is serious.

http://www.electricalpollution.com/smartmeters.html

http://electricsense.com/2225/smart-meter-radiation-3-things-you-must-know/

http://www.youaretheanswer.ca/radiation-sources/smartmeters/

But basically sometimes some of you give a wonderful rant on the topic, I enjoy very much from a Hams point of view. Very logical, very interesting, usually right on and usually intelligent. And usually accurate. So I asked the question

Why some fling the mud? Maybe you just wanna argue or rag chew or whatever, but the Hams I always knew were most eager to help, most eager to share their knowledge on the topic, and I still know a lot who are like this.

I still would like to hear some Ham's opinion on these topics, there is no geological newsgroup that is active, already tried, so those chunks of beautiful granite I have on my sauna heater came from deep below the earth's surface in Northern Ontario and my 530 does show activitiy when near them, not near as much as the smart meter, I know it is sensitive. And I know it is small amounts of RF, so just curious

73

> teaching skills. I can almost predict with great certainty that you are
> not a teacher. None of your advice or comments were constructive, or
> informatonal or helpful. None.

And you have very poor listening and language skills.

> I wouldn't even want to work beside you.

I can assure you that will never happen.
I would never hire someone like you.

>
> However, without knowing you I can estimate you have more knowledge
> about electrons, protons, rayons and electronic circuitry than I do.

That is a correct estimation.

> I will give you that David, however I can bet you dollar to donut that
> my list of credentials is far longer than yours,

Sure, I'll take that bet. Let's see the list.

>
> I haven't paid anyone to teach me about RF

That's obvious.

> Are you the ham who complained about me fixing my own furnace not long
> ago?

I guess you'll have to learn how to use Google to find the answer to that
question.

> Are you the same chap who said to me that rocks don't emit radiaton?

You need to go back and read my post. That isn't what I said at all.

Someone who has this much difficulty with reading comprehension shouldn't
be posting on Usenet.

> trying to make me look even dumber

You don't need my help with that, you're doing a fine job.

```

Hello, and the chapter "Long Wire and Traveling Wave Antennas" in "The ARRL Antenna Book" gives theory and practical Beverage antenna designs for one- and two-wire types. For the case of a one-wire Beverage a non-inductive terminating resistor in the range of 400-600 ohms is typical. It should be emphasized, however, that the precise value of the termination has to be determined by experiment for optimum rejection of rearward signals. Sincerely, and 73s from N4GGO,

```

It is about 10' from the feedpoint on my 80m horizontal loop, and about 6 feet from my Yaesu HT in its charger base. The meter uses 900 MHz spread spectrum and I do not expect any ill effects. I already have half a dozen wifi signals here, besides my own, and the steel plate in my head hardly sings at all.

Hey, That is great news Dave (if that is your real name, because you like to use two names, hmmm).

Mighty coincidential that you happen to receive it the same day I posted about it. Are you sure you are not trying to make up more stories? Hide some embarrassing comments? Because you were wrong Dave, I must point that out Dave, you were wrong. But a quick post by yourself doesn't change it or hide it, you gave wrong advice. I asked a question, you gave wrong answer and I proved it to you. You can scramble to fabricate anything you like Dave, shows your level of integrity. I think you lost face.

And great that you instantly googled it to find out the details and facts about it, as a few days ago you knew nothing about it. I guess you can thank me for your new desire to learn about your (new) smart meter.

You changed your tune also about that bet I said, I said 1g because you claimed I wasn't licensed. However a list of credentials is also an easy win for me but I think by the amount you have already lied and tricked and your false parses, means your integrity level is very low. Not trusted. Maybe it was me who baited you, anyways, not too bright.

Anyway Dave, you can parse me or cust and paste or change my words around all you like. I believe you showed your true self here today, not too bright.

Anyway, I am still interested to hear from knowledgable hams about these topics, I will google more about them and learn more, that is my goal to learn.

I know there are groups lobbying govts and industry because of these smart meters emmitting high amounts of emmissions and while Dave says it is completely safe, a lot of googling that I read claimed it wasn't that safe. I appreciate your try Dave and your input, but I will stick with the other sources available.

Anyways, at least I caught you there in a couple of lies Dave, it wasn't that difficult, you actually shot yourself in the foot. Are you sure you are a true ham? I think appliance operator.

Anyways, I don't want to drum up another hornets nest here, I caught Dave in his fabrication, he tried a desperate yet feeble attempt to recover from giving wrong and bad information, but lost face in the process. At least I oppologized to the group for starting this, I think Dave owes the group an opology. I wont push it though, I will drop it. I just like pointing out the facts.

If you try to parse my comments again Dave (if that is your real name) or whatever account you use (I see you have at least two) please be accurate this time, last time was feeble attempt to cover up your embarrassing facts about giving me wrong advice. Wrong answers, Oh, then 12 hours later your Smart Meter arrives and you are world expert in it,,, lol,,, oh my,,, oh,, that is funny. Sorry dave, that is too funny.

Anyway,,, sorry again to the group,,, great knowledge here, I didn't mean to make fun or laugh at the group's trouble maker, it was just too easy, plus he started it, he said at first things about me that were unfair and untrue and his answers and advice and criticisms were wrong. I had to point that out beyond a reasonable doubt with facts. He really shot himself in the foot.

Anyways,,, (I know, last one),,,, sorry to the group. Great group, love all the advice and help I get from it. I am not trying for a pissing contest, I just asked for help because I know there is a lot of knowledge in this group and some of the side lines the conversations can go are fabulous, i mean when they stay on the topic and I learn more. I am not in for the mud flinging or allowing the Daves out there to bait or trap me, but he was too easy this time, I hooked, lined and sinkered him. I think he did it to himself.

Anyway 73s

No Dave

Not a good idea to simply tie knots in your guy lines.

Because after a while the wind and rain and wind and rain will slowly cause them to come untied. Very bad idea, very bad advice.

You would be wise to at least tape the heck out of those knots, so to prevent them from coming undone, and your tower or antenna falling over. I mean that is the purpose of the guy lines.

But a simple granny knot wont work Dave. Once again Dave, some bad advice. Have you ever owned a boat? lol,,, I bet you tied it up one day, came out the next and it was gone. lol,,, oh my,, that is too funny.

I recomment starting an immediate course with the Cubs, then work into Boy Scouts, they will teach you Dave how to properly secure something using nylon rope or any kind of rope. Never tie a granny knot Dave, you should never, ever tie a granny knot for your guy wire for your tower. Lol,,, your neighbors are probably sleeping on pins those windy nights. Oh my.

Turnbuckles are cheap and easy way to keep tension equal and tight on towers. Make sure your connections are tight and never use granny knots, use clamps or at least a double Winchester,,, lol,,, oh,,, oh my,,, Dave,,, you got me today Dave... Oh stop it... lol,,,, oh my.... Tie your tower with a granny knot... Oh my... lol,,,, Dave you are the limit.

No That is wrong Dave

Dave, I have learned not to accept anything you post. I think you are just trying to make fun.

You couldn't be further from the facts on this. And dangerous for you to even comment.

Your comments from now on will be taken with a grain of salt.

You have been proven wrong too many times.

But you are funny, I will give you that, you are humorous.

I don't consider dbi a trick, just another standard of measurement.
If you use dbd you are comparing to a dipole which has 2.15 db gain over
an isotropic antenna. (I think you transposed to get your 2.5)

>I think the OP antenna was an omni, the panel antenna is directional.

Yes, however even the omni is directional, but in the vertical direction
vs horizontal. There are higher gain omni antennas available.

http://www.ebay.com/itm/20dBi-High-Gain-2-4GHz-RP-N-Omni-WiFi-Router-Antenna-/
250790187736#vi-content

http://www.google.com/products/catalog?
q=high+gain+wifi+omni+antenna&oe=utf-8&rls=org.mozilla:en-
US:official&client=firefox-

a&um=1&ie=UTF-8&tbm=shop&cid=18268083184734573997&sa=X&ei=uRcLT_KKKsfatwfuq4nLBw&v
ed=0CIMBEPMCMAI

That's why I added,
"But that depends on your application, sometimes you don't want a tight beamwidth"
Probably all for naught, the OP seems to have gone on to other things.
Mike

The next link will be to a psych medication

My "tower" is a fiberglass mast. It has 3 guys at about 1/5 the way up, to keep bending force off the base. The rest is 6 tubes stacked up and a #12 copper wire coming back down the inside. Very graceful in the wind; it can bend over 90 degrees and always rights itself, just like a good sailboat should. Cheers.

Nope, Sorry Dave

I didn't mistaken anything. Just pointing out the facts.

But lets not dwell on this matter. I still think you owe me and the group an opology, but thats up to you.

Anyway, Ya, I learned a lot about these smart meters recently, big issue in many areas and many groups are up in arms about them.

I guess that is advancement in technology as I am sure the water meter will become a smart transmitter, more and more our lives are filled with these EMFs all around us.

There are cautions regarding granite counter tops, very high emitters.

Anyway, don't worry about it Dave, lets let it go. Let it be.

Thanks Dave

But once again, little too little, little too late.

But nice try,

Again, lets let it be. Lets not dwell on it.

As all EME operators know, ok not most of the new digital only types, dirt and rocks emit PLENTY of RF. So much that EME array design takes it into account. On 432 and up it is a major problem.

No, an HT won't notice, but a barely halfway decent noise figure receiver on 432 will.

I did neglect to mention that Tukster reminds me of 2 someones who've been missing from here for a while.

Both of whom always managed to prove that they really should stay on their meds.

Don't leave us Tukster, we've needed some laughs for a while.

Someone needs to point out that you can't take all rocks for granite.

Simple solution to the knot problem.

Tie your knot's and then use a zip tie to hold it in place - on the
ropes past the knots.

You can buy inexpensive - small GB zip ties in Lowes - for a couple of
dollars per 100 ties.

Tape will also come loose after prolonged exposure to sun and weather.

Then again, I limit most of my purchases of electrical tape to Scotch 33
brand 3M tape. The cheap stuff never seems to hold up anyways.

That is good idea, something to stop the knot from coming undone.

Dave just ties a granny knot on the bottom of his guy wires. Seems to work
for him, 1/5 the way down. I was a little worried there as these simple
knots can come undone after a few wind storms.

Lol

That is good David,, you are good at making up stories. But not too good at recovering from an embarrassing situation. You see the facts are clear, I asked some advice, your answers were wrong, then you flung some mud, called me a few names, accused me of not being licensed. But I proved you wrong, (smart meters, granite rocks) so now you obviously have googled these topics and have some ideas about them. But still, you are trying to recover from an embarrassing situation where you were caught in a lie.

Don't worry, yes I believe in Feng Sui, very much so. Your comments about my gf are childish, I wouldn't make comments about your family, are you racist also?

It is called Meinze,,, it means Face in Asia,,, you obviously have lost face within your crowd here and now trying to recover some of that "Face". Very important for Asians, but I didn't think western people give a shit about Face. But I see you are trying to recover from lost Face. I wont rub it in Dave.

No, I didn't put my HT beside the heated Granite rocks on my sauna, that is ridiculous, you simply made a story there, nobody is that stupid. That is attempt to make this situation look a bit funny, take some focus away from the fact that you lost face because you got caught in a lie (Oh, my smart meter arrived this morning),,, remember that David? But lets drop it, I don't want to rub it in any further,, I am sure time will help, it will allow all your peers here to forget your ignorant comments and answers to my questions (ignorants doesn't mean stupid, only means lack of knowledge on the topic). Facts show that you were ignorant on Granite Rocks and Smart Meters, but now you have knowledge of these topics. You can thank me David for helping you to learn about Granite rocks and smart meters.

Anyway, I wont drag you though the mud David, lets let it be. You screwed up Dave, got caught in a lie, gave wrong advice, and I proved it and showed it clearly. You can cut and paste, parse whatever you like, You can twist my words around dave, that is not ethical, but you can do it if it helps you to recover from lost face. You can try anything you like Dave to help you recover and regain some face, up to you. Please be respectful. I am just having fun with you now, I wont fling anymore mud. Lets let it be.

Anyway, have a great day

73s

I've recently had some problems with crimp on N connectors on LMR 600 super flex cable. Although the connector seemed to be well waterproofed there was corrosion between the coax shield and the connector at the crimp. This problem was found on three antennas that used this connector and cable. I suspect it was a poor quality connector that caused the problem. Connectors plating was peeling off at the point of connection. If someone could advise me on the best quality N connector for LMR 600 super flex I would very much appreciate the advice.

Jimmie

Hey, Dave

That is called Ghosting or Mirroring,, that is illegal.

For you to put my name and my email address in the sign up information then post something pretending you are me.

Not only is that low, unethical, childish, but it is also illegal. If I were to report you to your news server through the Abuse channels, you would receive a warning first, then criminal charges follow. I will not do that. I just like pointing out facts.

For you to even think of doing something this childish, to fling back at me, is simple concrete proof that I must have embarrassed you among your peers here and for that David I am sorry. I didn't mean to embarrass you. Not this bad. Please do not do anything drastic. I hope there are no tall towers near you.

Anyway, come on David, lets let bygons be bygons,, lets live and let live, lets agree to disagree already. I can see this is really bothering you. I didn't mean to upset you this drastically, all I wanted to do was learn something and this is how you treat someone asking a simple question?

Anyway, what you did was illegal, it is called Mirroring I think. Where you took the time to write down all my information, YOU TOOK THE TIME DAVID, you must have spent more than an hour, then you put all that information (my information) and put it on your computer so your posts would look like it were me. I know hams are sometimes old dinasours, but this is as old a game as the hills on Mount Zion there David. Plus it is illegal, plus it is unethical and shows low class. Very low class David, now I must ask you, are you sure you are a legitimate Ham Amateur Radio Operator? This isn't the style of most of the Hams I know David, no, this is low. I think you are CBer. You should be associating with the truck drivers. David, you kind of shot yourself on this one David.

David, you questioned my being a licensed, legitimate Ham, something I think is highly respected, I look up to Hams, I asked you for help. I figured Hams, (and I still do) but I figured are a cut above the rest. This is why I asked you people off topic questions. David, what you have proven to us is that you are nothing more than a glorified CBer. Now I am willing to bet you (remember you wanted to bet me?) but now I am willing to bet you, that there is a CB hooked up in your shack, fully operational. I will make that bet. Funny, last week you wanted to bet me,,, but then you hid under some covers,, you did't follow through.

O well David, what you did today was illegal and unethical... I am shocked, surprised and saddened. I really don't know what to say, I am at a lost for words (wouldn't you know it?)....

Anyway David, I will let it be,, who knows what you will do next,,, who knows what you are capable,,, and you asked me to put my call sign on signing off? LOL,, is that your style David? Are you going to come throw a rock through my window at 3 am david? Sorry David,, I didn't know who I was dealing with here,, and I didn't expect you to go this far,,, I wouldnt have pulled on your chain this long had I known it would have bothered you this much. For this David I oppologize,,, I will say sorry because I don't think you have slept well for a couple of days,,, all because I dragged you through the mud you were flinging. I am sorry for that. I know how much it bothers you.

Oh well,, try to keep it clean next time David, lets keep it clean. I wont report you, I wont do anything about it, i will let it be. Sorry I ruffled up your feathers there David,, so get over it already. Stop baiting me, I gots better things to do.

Enjoy the weekend,,,

David,,

I am sorry again, I just feel I must correct you here, maybe it is the teacher in me.

But you did it wrong, there is supposed to be a couple of spaces before the Tuuk. You missed that. (not surprised)

Also, Feng Shui has nothing to do with radiation, more of the winds and water. It is all about improvement, improving your life, improving your health. Both yours and my ancesters were much involved in this way of life and utilized it to maximize their wellness. So your ancesters David were very much believers in this David, don't mock them. You can mock me, but don't mock your ancesters there David. Not classy. Anyway, you can google this and learn about it and comment back in a few hours as an expert (again). Same thing with putting my name on your computer and trying to post looking like me,,, don't forget to put a couple of spaces before the Tuuk,,, if you want to perform another illegal and unethical act again David,,, do it right if you are going to do it.

But thanks for attention David. But give me something useful.

Good luck

```

Hi David

Again, what you did here was illegal and unethical.

You mirrorred me, or ghosted me. Meaning you put my names in your newsreader account so you would look like me posting. But you should have put a couple of spaces before the Tuuk,,, and it still actually shows your server. So very bad attempt at doing something illegal and unethical david.

Sorry I have gotten you so upset david..

I'm hoping to use these 16 footers for an antenna mast, but I'm not sure how to transport them. I own a Ford Taurus stationwagon that has a rack on top. Delivery fees are way too high for just a couple of posts. Is it possible to transport two at a time with my stationwagon? How would this be done?

Thanks,
harry

I'm guessing that the roof rack of your Taurus consists of rails which run front to back on each side of the roof. If so, your best bet is to fasten two cross members running from side to side at the front- and rear-most part of the rails. Then you can lash the lumber to the crosswise members.

That all assumes that the lumber is rigid enough so that it doesn't flap around under its own weight and that your Taurus is long enough that the lumber doesn't protrude too far front and rear. You might want to tie the front and rear ends of the lumber to the front and rear bumpers somehow, and might be required to attach warning flags to one or both ends.

Not familiar with the Taurus but my friend had a similar issue. He
bought a strap on luggage rack but when he tried to mount it he
discovered it was supposed to strap on to the rain gutter but his car
light a lot of new ones didnt have them. He was able to fasten the
rack in place using bungee cord that he stretched all the way down to
the bottom of his car.

Also,  a 16-ft 4x4 is likely to weigh over 50 pounds, depending on
moisture content.

Do with the 4X4's what Mitt RMoney did with his dog: Tie 'em on the
top of the car.

Lay all three 4X4's on the rack with equal lengths sticking off each
end. Tie each one individually to the roof rack, then, tie the bundle
of three to the rack.

Drive normally, but stay a bit below the speed limit and don't take
corners and curves on two wheels.

Hello!

I'm planning to build a parabolic reflector using aluminium net.

The kind of net i found is just a weave of aluminium threads, no connnection between the threads. Is this going to reduce the performance of the reflector?

The net is built of 0.4 mm thread and the hole size is 1.5 * 1.5 mm.
I'm planning to use the reflector on the 23 cm band.

73

I don't know where you live, but there is always a lumber company some where that will deliver small loads for next to nothing or free.

Or if you knew of someone who was a contractor that had a ladder rack on the truck, that could haul them for you, you would be in luck.
I have not done construction work in about 2 years, but I would guess the weight of each 4 x 4 wet would be around 45 lbs.
Most luggage roof racks will not support 180 lbs of this type of weight.
There is no front or back bumper to tie off of and no way to support the weight - because the body of the car is unibody - hence there is no frame, the roof is a part of the frame and you can cause damage to the glass when you put a lot of weight on the roof if the roof buckles.

4 x 4 treated does not make very good mast material.
Use Aluminum or steel pipe.

If you look in Lowes or most electrical supply stores, you can find 1 1/2 semi rigid conduit for about $15.00 a section. They are threaded on both ends and has one coupler supplied with each joint of pipe.
I live in a high wind zone - winds in excess of 65 miles per a hour during storms and my Solorcon 99 antenna has sat at the top of 3 sections of pipe for 9 months now without any bending and it has no guy wires.
There is only 8 feet supported by brackets - so there is 22' of unsupported antenna mast holding up a big long antenna.
Find someone with a arc welder and have them design and build you some wall brackets, preferably out of used steel, (3/16" x 2.5" x 2.5" would hold up a lot of weight with guy wires) and purchase some muffler clamps and attach the conduit to the brackets and the brackets to the garage or shed or side of house and you will have a cheap mast for less then $150.00 if you do it right.

I don't think it is a good idea and would find another material.

First off, long timbers like that will spin and twist after a few months of drying, they would need strapping or something to prevent them from twisting and spinning on you. You should use aluminum or something better.

Second, by transporting those long pieces you are probably breaking some laws in your state, you may get a nice fine unless they are flagged or use lights or proper transporting procedure.

Also, what if the guy behind you doesn't see the flag or logs on your roof extending back 4 feet or more behind your vehicle, then wamo right through his/her windshield and that could be deadly. Very risky to transport like this, get someone with a pick up truck and tie them to the side, front bumper and back bumper and side mirror. Not a good idea but if you had to as it will scratch the side of the vehicle, we used to deliver pipe this way.

Pressure the lumber yard, ask them to be more resonsible and tell them your issues, you only have a short vehicle and their delivery fees are unreasonable, talk to them, I am sure they would agree that the way you want to deliver them is unsafe and unpractical, I am sure they would help out in some way.

But I wouldn't put them on the top of a little car and attempt a very unsafe deliverly like that. You might be on the front page of your local newspaper.

Your taurus wagon is how long?  About 15 ft?

Tie them on the rack, not hanging over the back too far.  Tie a rope
from the front of the logs down to the tow lug under the front bumper
to avoid side to side swings and too much up/down bounce.

The more you can center it fore and aft on the rack, the better, but
you don't want to hang too far off the back, or you'll need to flag
it. Check your local vehicle code, in California, more than 4 feet
past the taillamps (not the bumper!) needs a flag (or light at night)

Whether you tie them together or spread them out is sort of up to you,
and the construction of your roof rack.  I'd probably put them both on
the passenger side, or which ever side has the tow lug in the front.

Obviously, you don't want to be doing your SCCA solo 1 racing in this
configuration.
```

The other strategy (I've used it with pipes and masts) that's a bit more dicey is to sling them along the passenger side of the car, using webbing around the door posts/windows. Wrap lots of towels or padding so you don't scuff the paint. Flags almost certainly necessary, etc.

A not very good strategy is to stick them all the way through the car onto the dashboard and hanging out the back window, but I think that will wind up with 6 ft or more hanging out, and it's hard to secure them. if you stop fast, they slide forward a few inches, and you just bought a new windshield. (been there, done that, with 2x12s in a Honda Civic hatch back.

And finally, the most bizarre, but sometimes works.. tie it UNDER the car or truck. There's usually structural members, etc. But make sure you have enough ground clearance. In California, nothing on the car or attached to it can hang below the bottom of the wheel rim.

Don't overload the rack. Typical ratings are 50-150 lb.

If it helps, I recall a long-ago rule for perforated and mesh
satellite dishes.  The hole diameter could be up to one-tenth
wavelength and the reflector surface would still appear solid to the
EM waves.  I had a 3m mesh dish for 4 Ghz c-band TV.  It consisted of
twelve unconnected panels.

I'd say try it.

From my imagination:  If you were to set up a normal VSWR test with
your 23 cm gear and move a section of the mesh toward the antenna,
you'd know somewhat whether the mesh is a reflector or is RF-
transparent.  Compare the VSWR change to a corresponding test using
solid material.  Just a thought from my fertile brain (with no mention
of what kind of fertilizer).

I had to move a big (disassembled) HF beam antenna with a mini-van.  I
used wooden grape stakes(1 x 2) to make an expanded version of the
existing roof rack, such that the cross-members were about eight feet
front-to-back and provided adequate support for the 30-minute trip.
(The stock cross-members can be separated only about four feet.)

I would say the antenna weighed more than one of your posts, but less
than two.  Two trips?

Of course, you right, empirical is certainly a good way to decide if the
net is good enough. The secret fertilizer you use seems to work ;)

Approximate diameter? How much gain to you need (or expect)?

>The kind of net i found is just a weave of aluminium threads, no
>connnection between the threads. Is this going to reduce the performance
>of the reflector?

It won't reduce the gain, but you're going to have another form of entertainment. Because the wires in the mesh are not electrically connected (welded), you run the risk of creating small diodes at each crossover as the aluminum oxidizes. Similarly, as the wind blows through the mesh, the wires will scrape against each other, creating small sparks. I found this problem the hard way when I built a 1.7GHz WEFAX dish using aluminum window screen material. I spent a few months trying to isolate the highly intermittent noise sources. I eventually smeared spray glue on the window screen mesh, and plastered it with aluminum foil, which eliminated all the noise sources.

Note the C-Band DBS dishes may have holes in the mesh, but the mesh itself is solid sheet metal.

>The net is built of 0.4 mm thread and the hole size is 1.5 * 1.5 mm.
>I'm planning to use the reflector on the 23 cm band.

A 1.2GHz dish will probably be big. You're going to have some structural issues to deal with. If you build a deep dish, getting the wire mesh to make the required bends is going to be difficult, unless you build it in wedges. If you build a flat dish, the mesh is easier to handle, but the support for the feed might be ridiculously long.

I suggest you read the details of dish design, especially the part on matching the f/D
(focal length / Diameter) of the dish, to the illumination angle of the feed, which has a big effect on the dish efficiency:
<http://www.w1ghz.org/antbook/contents.htm>

Mesh dish kits:

Long ago and far away, I had one of those. It was not made of mesh, it was made of a piece of sheet metal that had been perforated. The holes have to be exact, besides the problems Jeff mentioned, they have to be small enough and properly spaced that the dish still acts as a reflector at the frequencies desired.

That's why Ku band (10gHz) dishes are usually solid. The mesh would have to be very fine and precise.

The holes are not there to make it cheaper to produce the dishes, they are to reduce weight and wind loading. I assume in colder climates they are also there to reduce build up of rain water or snow.

Here in Jerusalem we have snow storms every 4-5 years. The last one was enough that the snow caused our satellite dish to malfunction, which was not welcomed by two kids stuck at home. Due to the rarity of the snowfalls, the hilly terrain and the warm temperatures, schools just close for the day of the storm and then reopen the next day after it has all melted.

Geoff.

I'm interested to do some experiment with the stress dish concept:
<http://www.nitehawk.com/432_MHz_EME/port_dish.pdf>

The antenna is to be used at my country cottage, I don't want to convert
it to a modern communication centre ;) In the winter there are storms
and it can snow heavily at occasions. The stress dish would be perfect
to do some experiment with in the summer period and then put it aside
for the winter.

4m in diameter is the plan, I expect a gain just below 30dB, if I'm lucky.

The noise would be a real problem as the ultimate goal is to use the
antenna in EME works. Maybe a traditional galvanized chicken net is a
better choice? There are nets with 13*13 mm, around 1/17 lambda witch
should be OK.

Ben / SM0KBW

I was walking on the beach when I found an odd lump of something with a few wires dangling out of it and in the way that you do, I bashed it with a rock to see what was inside. ;-)

Eventually I dug this out.
http://www.zen31010.zen.co.uk/images/mystery_object.jpg

It's about 6 x 4 cm and about 5mm thick. It's definitely NOT a mechanical component and I think it's perhaps from the base of a radio aerial, probably off a boat. I think originally there would have been a conductor threaded through the "S".

Can anyone confirm this (just for curiosity's sake)?

Tim

If these work at 2.5 GHz, I think you'll be able to use about anything as long as the parabola is correct. http://www.qsl.net/n9zia/wireless/page04.html

Ummm... 10GHz is X band and DBS Ku band is 13Ghz. There are a few
wire mess and/or perforated sheet metal dishes available for DBS
satellite TV.
<http://i01.i.aliimg.com/photo/v1/475037631/KU_BAND_75CM_SATELLITE_MESH_DISH_ANTENNA.jpg>

Nope. There are black teflon coated dishes for that. Some have
heater wires imbedded in the fiberglass reflector. Also radomes. The
problem with ice and mesh is that the mesh is generally weaker than a
solid dish. Once encrusted with ice, the mesh might rip, bend, or
tear.

Paint it with glossy black paint. I did that to some white fiberglass
antennas. The ice just slides off the antenna once the sun appears.
It's not a total solution, but it helps.

That works for a few days. The problem with reflectors under tension
is that they don't stay in any stable position. The aluminum mesh is
the worst because it moves with temperature. If you look carefully at
various mesh reflectors available, they're usually galvanized steel.
However, at 1.2Ghz, the tolerances are much less than at X band or Ku
band, so it will probably work.

>The antenna is to be used at my country cottage, I don't want to convert
>it to a modern communication centre ;)

The uglier the antenna, the better it works. Nice looking antennas
just don't seem to function as well as ugly kludges. Might as well
resign yourself to building an eyesore.

>In the winter there are storms

My I suggest an infaltable dish antenna? (I'm not joking).
<http://www.gatr.com>
<http://www.qsl.net/pe1rah/RAHdish.htm>
<http://ieeexplore.ieee.org/xpl/freeabs_all.jsp?arnumber=1203415>
If you want it out of the way when the neigbhors arrive to protest,
and inflatable antenna structure might be the answer.

Another design I tried (and discarded) for the WEFAX antenna might be worth raising from the dead. Instead of a dish, it's a parbolic "strip" reflector. It was in the shape of a parabola in one axis (as enforced by several sheets of plywood cut into a parabola like shape), but was less than 1 meter wide. The idea was to obtain the same surface area as a large antenna, but with a very different aspect ratio. That makes it much easier to build, ship, and assemble. I'll see if I can excavate some photos.

>4m in diameter is the plan, I expect a gain just below 30dB, if I'm lucky.

That's a reasonable size without becoming monsterous. No clue if you'll get 30dB. I could do the calcs, but I'm busy right now.
<http://www.antenna-theory.com/antennas/reflectors/dish3.php>
Use 50% of the overall efficiency.

>The noise would be a real problem as the ultimate goal is to use the
>antenna in EME works. Maybe a traditional galvanized chicken net is a
>better choice? There are nets with 13*13 mm, around 1/17 lambda witch

I'm not sure, but I think anything under 1/10 wavelength should work. Welded galvanized steel mesh should be fine.

Nicely built 4.5 meter dish:
<http://www.keplerian.com/dish/4.5m_dish.html>

Gotta run...

The stability is one of things I want to study - and you're probably
right in that long term stabilty will be a problem. I've done some
calculation and used 45% efficiency and the result was around 30 dB.

Yes I've thought about single curved parabolic reflectors as you
describe, but it would give polarization in one plane only and the
standard is circular polarization for EME at 23cm.

I will certainly consider inflatable antennas, funny idea!

Galvanized Chicken net is easier to obtain, cheaper and as you wrote,
it was what people used in earlier designs.

I have just spruced up the AIM4170 Resources Page:

http://homepage.ntlworld.com/wadei/aim4170.htm

The new page includes a link to my article "AIM4170 Revisited" which the RSGB recently published in RadCom.

The article focuses on three aspects of AIM4170 operation:
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
* Using custom scanning to measure the impedance at the antenna feedpoint.
* The Time Domain Reflectometry (TDR) feature.
* Remote operation using a wifi network connection.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

That is a double edge sword.
You can get increased propagation when it hits, or you can get a total
blackout - like we have had the last couple of days.
The last time I looked, the solar index was only about 88 - which is not
good if you want to work 10 meters.
There has been days where you can't hardly hear anything on the 80
meters during the day here and the 40 meters was just as bad and the 20
meters was almost impossible to hear.
At the same time, when the HF bands drops off, the VHF and UHF
Propagation increases. A good time to work SSB 2 meters.....

I don't think it will be too horrible as long as the antenna parts and pieces can be adjusted for optimum performance. At 1.2Ghz, that shouldn't be much of a problem. If you were building at 10GHz, I would be seriously worried.

>Yes I've thought about single curved parabolic reflectors as you
>describe, but it would give polarization in one plane only and the

Nope. As long as the width of the antenna is 1/2 wave or larger, it will work with CP. I don't think that there's any way such a reflector can convert circular polarization into elliptical (but I'm not sure).

>I will certainly consider inflatable antennas, funny idea!

Not funny. I've tried to build an inflatable tower for Field Day for the last few years. Each year, something goes wrong, usually by running out of time. With the proper materials and design, inflatable antennas are fairly simple to construct out of vinyl and glue.

Incidentally, China has a storage space problem. So, for the annual
parades and events, all the decorations and props are inflatable. When
not in use, they're fairly small. Something like these arches:
<http://www.china-inflatable.com/products/inflatable_arches_1.htm>
Bosch Aerospace used to build inflatable towers for the military. It's
now LTA Projects. The videos are fun to watch:
<http://ltaprojects.com>
Yes, they have a ham version:
<http://ltaprojects.com/ham.html>

>Galvanized Chicken net is easier to obtain, cheaper and as you wrote,
>it was what people used in earlier designs.

WELDED galvanized wire mesh, not ordinary chicken wire. Most chicken
wire is not welded.

-
As far as I am concerned, the HF bands have been in the dumper for a month
or more.  Although I have heard a little more activity in the past few days.

Haven't heard a signal on 6 meters in a long time.

I'd like to try building a loaded Yagi. I came across plans for a 20 meter
mini Yagi while Googling, but I want something for 15 meters. Are there any
simple, free calculators available? Also, can anyone tell me a ballpark
figure how a 15 meter shortened (by 40%) 3 element Yagi would compare to a
full sized one? How about if I added an additional element for 4 loaded
elements instead of 3?

Thanks,
harry

MMANA has a 3 element loaded yagi as an example.

Http://hamsoft.ca/pages/mmana-gal.php and it's free

Short  Yagi W1FBY & WA1LNQ

It's  got a gain of about 4.7dB

I dare say 4NEC2 will model it as well.

        To ensure traveler's security, transportation security
        officers (TSOs) may determine that an item not on the
        prohibited items chart is prohibited. In addition, the TSO
        may also determine that an item on the permitted chart is
        dangerous and therefore may not be brought through the
        security checkpoint.

A news snippet in today's newspaper tells the story of the TSA taking
a cupcake away from a woman because *the frosting could be dangerous*.

There may be more to The Story -- but I won't be surprised if it's no
more complicated than that.

Hmmmm. I got to thinking about your two bearings. The bearing from
Birmingham to London is 44.54 degrees. I don't see how it is possible to
get those two values from a fixed location.

What have you done wrong or what have I done wrong?
```

John

Ah! Now I see! I mistakenly assumed Birmingham, Alabama. My face is red
for not noticing the <g>. Good one!

Cheers,
John

Ha! I don't mind a laugh at my expense for a good, clean one like that.

Cheers,
John

Summary: Short reminder for unmoderated newsgroups that crossposting is permitted
Keywords: FAQ, ham, amateur, radio, moderated, unmoderated, crossposting,
permitted

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.2 2011/11/02 04:08:53
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/
d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider       |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup.  After a successful trial         |
period (90 days, through early July 2009), we decided to adopt this           |
change permanently.                                                           |

Approved rec.radio.amateur.* newsgroups are those that are currently
```

listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

No, sure not, from the description.
Because it takes two USB ports, it obviously contains one
USB WLAN stick and additionally one WLAN booster.
When using one uSB only it will work as standard stick.

I don't know of course, but that is what it looks like.

w.

More accurate would be "Weatherproofed External Wifi USB adaptor". Not
just an antenna.

Might be, but I mentally ID'ed one cable as the conventional WLAN stick and the other to be a control lead. See, I know of no software to pick whether an internal amp should be used or not used. If the amp were out of the circuit EXCEPT when the other USB cable were plugged in, that could serve to let the user go into distance mode. It would take tiny relays or some PIN diodes to impliment such active switching but it's do-able. (Consider that some FM radios have a LOCAL/DX switch for user control.)

Just a guess.

One of my beefs with most preamplifiers is that, once installed, they _must_ be used; take off the DC and they turn into attenuators.

I'll see what facts I can dig up to support my wifi usb conjecture -- or to demonstrate that I'm a moron.

Still having fun playing with my 8.5 foot whip on the metal patio roof, with coax feedline to an antenna tuner in the shack. Operating on 15,12, and 10.

The antenna tuner is a typical t network with series capacitors and an inductor to ground. I was unable to get a match on 15 meters with the antenna tuner. So, I thought I would add more coax to the feedline and move around the SWR circle on the Smith chart. Apparently this provides a set of matching parameters that the antenna tuner can now cope with.

I don't have instruments to measure many parameters, but a rough guess is that the 15 meter SWR is at least 20:1.

So the question is: are there parts of the Smith chart that are going to be more difficult to match, and should be avoided?

Most likely that the whole unit takes more current than 1 usb port can provide, so like some external DVD drives is needs 2 USB ports.

Try rearranging your network, try pi series C, pi shunt C, etc.

Also make friends with someone with a vswr analyzer ;-)

EZNEC sez the feedpoint impedance is around 17-j175 ohms with an SWR
of ~40:1 at the antenna feedpoint. Minimum impedance ~1.25 ohms,
depending on feedline length. Not many tuners will match 1.25 ohms
with reasonable efficiency. In this case, a feedline length of an
integer number of wavelengths (N*30') plus 13 feet would probably
allow for a reasonable tuner match for VF=3D0.66 coax if you can
tolerate the considerable feedline losses.

No I haven't. What would be the practical tests? Example, measuring FS at
x feet from the antenna at y height above the cover, vs below the cover at
what point?

Or, I could leave in the additional feedline ;-)
But a good point is that I have an old homebrew 2 element tuner with
alligator clip configuration.  Might give that a try just for fun.

I have one of the older MFJ analyzers, but I wouldn't trust the accuracy at
high VSWRs.

Thanks for the comments. When I used EZNEC I didn't know what to use for ground, so I used Real/Minimec. I'm showing about 18-j142 as the feedpoint impedance at 21.1 Mhz, which is not totally out of the ballpark with your number.

At any rate, I have bought enough telescoping tubing sections to build about a 20 foot vertical. Final height is subject to approval by "the Admiral". Fabrication of a more substantial base support will be necessary.

In the meantime, this AM I replaced the 8.6 ft whip with about 13 feet of telescoping tubing, using the same mobile whip mount clamped to conduit. Resonance is around

18.7 MHz and it loads up nicely on 18 through 10, with 10 meters having the
highest calculated swr of 17.

With the antenna removed, the feedline shows a 1/4 wave null at 4.33MHz.
This gives an estimated 1/2 wave electrical length of 57 feet at 8.66 MHz,
or with 0.66 VF a physical length of 37.6 ft. That seems about right.

I'll get a Smith chart and see where the existing feedline moves the
parameters.   Per your comments I'll try to avoid low r values.

Wish the bands would open back up like they were in Oct and Nov.

Yeah, I had that, then dropped it out. Good catch.

BTW, I looked and found no tech data revealing the internals.

    I was thinking, it would be a rough indication what proportion of
power is radiated from the feedline.

Good point, and I'm not sure that the feedline is currently in optimal
configuration.

The feedline lies on the metal roof to the edge, where there is a small 8
turn loop.  Then it goes another 6-8 feet to the tuner.

That. and it probably has a way to determine if one or both USB

connectors are connected. Then, depending on the USB connection,
it sets its signal level.

   The price is not terrible for an antenna and wifi adapter, however a
  4.5dbi gain antenna is a little weak. But that depends on your
  application, sometimes you don't want a tight beamwidth.>   There are
plenty of cheaper high gain antennas that you can buy

and connect a wifi adapter to.

Here's a 14dbi gain antenna for $40

http://www.wifi-link.com/product.php?action=product&class1_id=1&class2_id=4&class3_id=160&product_id=1142

Here's a wifi adapter that gets great reviews, I use one.
ALFA AWUS036H for $27

http://www.ebay.com/sch/i.html?_from=R40&_trksid=p5197.m570.l1313&_nkw=AWUS036H+&_sacat=See-All-Categories

Just add a cable to connect them.

There 100s of more antennas to choose from.
Mikek

Summary: Recruitment announcement for ham-radio-related FAQ articles
Keywords: FAQ, Intro, amateur, ham, radio, recruit, recruitment

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

With regular guy wires, we have metal turnbuckles to adjust tension in the
wire, but what about for nylon? I recently built an antenna that uses nylon
rope for antenna support at various spots. I need to adjust the tension in
the nylon rope and I'd rather not use metal turnbuckles as there are a lot
of spots that need adjustment and I don't want interaction with the antenna.
What's the alternative? Thanks

A cleat, assuming you have someplace to mount it.

Hi

I have the Yaesu FT530 handheld two meter and 70cm with battery.

The unit is very sensitive. For example, when ever I hold the unit near some devices such as my smart meter, all frequencies show receiving massive amounts of fuzz. When I hold near my phone (Northern Telecom phone with many lines and displays) it also shows full strength noise. Holding too close to the TV also, but other areas away from these things nothing.

What is this unit receiving that would cause it to go useless? Is it measuring radiation? IMF? RF? Gama? Alpha? Sigma? Cilium? Iodine? EMF? When I put it near the granit rocks on my sauna heater it shows a small reading of something, I heard there is radiation in rocks.

Any ideas what the interference is that I am picking up?

It is an older unit I know, are the newer ones this sensitive to area noise?

Any ideas what this is receiving from these devices or appliances that is making me curious?

Thanks again hams for any advice,,,

73

It's RF. Unless all that noise is on the fundamental frequency,
it seems to be rather open to out of band RF. Which is not too
unusual with the wide band receivers those radios have.
I bet you also get loads of intermod when in the middle of
large cities. :/

Hi
Thanks for the responding.

What RF would be causing that near my home's Smart Meter, that new meter they installed on my home. Are they transmitting the information from that meter? Wow, when I go near that the FT530 is useless. Should I tell the electrical supplier to ground that thing or replace it or something? Seems anything that goes near there is interferred with including mobile phone.

Another side question, do you know a online dealer who sells replacement batteries for that? I would like the FNB 27 with NMHD. I did a search and found some that were 40 or 50 dollars plus shipping. If someone knows a trustworthy source that is economical please let me know the link, thanks

IMHO it's a moot point. Buy a battery pack that takes AA batteries. The best
ones being the slow self discharge NiMH batteries. Then you can charge
it in a charger designed for AA NiMH batteries, or use an external charger
that works with the battery but charges based on the proper way of
charging NIMH batteries.

Too many chargers of that era charge by dumping power into them until they
overheat and then shut off. The result is cooked batteries. NiMH batteries
always overheat when charged that way.

New (available at least 15 years ago), stop charging when the voltage out of
the cell dips, which indicates full charge. They can be purchased cheaply
in many places.

Geoff.

The effects you describe are normal, nothing paranormal involved,
no Aliens, no brain control and no health danger.
Every radio does buzz and crackle
when brought into electromagnetic dirt.

Just about anything that generates an RF signal will also generate noise around that signal. The noise is supposed to be so weak that it doesn't travel far to interfere with other devices. Your handheld is most likely close enough to pick up that noise, and it is "in band" to the receiver.

It would also prevent the tube from howling or "singing" when the wind
hits just right.

Yes in some posts last week or so, I was talking about a steel whip.
However, I have ordered some telescoping tubing to replace the whip with a
longer radiator.  It won't be that difficult to take the antenna up and
down, but at my age, it's better to stay off ladders and roofs :)

Intelligent questions have a better chance of
receiving intelligent answers -- versus receiving QRM.

Is this a vertical whip antenna, a vertical tubing antenna, a vertical
pipe antenna, a vertical tower antenna, or even a vertical wire antenna?

Going back to the original post....
"Where does one acquire those slip on tips for vertical antenna elements.
Or
what readily available alternatives are there?"

I don't recall seeing slip on tips for whips, pipes, towers, or wires.
Apparently you have, so I will clarify by saying that it is 3/8 inch tubing.
Is that "intelligent question" enough for you?

Another idea.
Have used this for many years.
Put a small wood dowel inside the element, snug fit, make it flush with the
end of the element.
Dip end of element if "Dip It" or "Liquid Electricians Tape".
Have elements that have been up for lots and lots of years without a
problem.
Heat, water, snow, ice, UV; nothing seems to bother it.

Hi

I have the Keeprite 075 condensing gas furnace. Only about 10 years old. Honeywell pro 8000 thermostat. NUGM100EHB1 is the furnace.

My question is what happened all of a sudden yesterday when I think I had a bit too much humidity in the air, why did the furnace fail?

Now when there is a call for heat on the thermostat, what happens is both blowers run only. The exhaust blower venting out runs immediately on start up, the main house blower starts immediately on start up. But no clicking from the honeywell smart valve, no sparking or ignighting beginning or trying. Nothing else is happenening. No gas is going through the valve, no obstructions in either intake or exhaust piping. I just vacuumed everything out, I changed thermostates to the old one, same thing happens. I suspect either the motherboard which has no lights to blink to show alarms, or the gas valve which I had to replace couple years ago, But back then at least the igniters would light up and shut off immediately, told me it was a gas valve issue so replaced that and worked. All else looks clean and I smacked as many relays as I could see, checked all the tubes to see if connections are ok and seems ok. Even when thermostat is turned off, disconnected, when I turn the furnace on it only immediately starts up the both blowers and nothing else, no clicking, no safeties going on and off, no nothing. Anyone here have a suggestion other than hiring an HVAC contracting firm to come in and give me estimates? I know a board is about 50 bucks, easy to replace, gas valve is about 150 easy to replace, what ever sensor should be cheap and easy to replace. Any suggestions as to what to try next?

Thanks Hams, I know this is off topic, but I have gotten good advice from this group before and there are no furnace newsgroups of any kind on my server.
Thanks for any advice or tips or links

Probably due to your bad karma from posting OT material in usenet ngs.

Hi

Ya, I googled it a lot, found some information but nothing explaining why the furnace's both fans run immediately with nothing else happening.

Suppose I will try replacing components one by one, I'll go by most replaced components. I can google that.

I tried jumping the high low switches, the vacuum switch, cleaned out the chamber, cant really see the ignighter but that is an easy replacement and might as well after 10 years. I heard they rarely last that long.

Got some excellent advice from this group before, will do it again.

When you say no lights to blink - do you mean it has no lights on the board to do that
or do you mean there are lights on the board but they do not light up.
If the latter, it would certainly seem to be the board, if the former then, darn, no help there.
Having had a similar problem my first replacement item would be the motherboard.
Normally the vent blower comes on to purge the system for a few seconds, followed of
course by the igniter, then the gas valve and after a short warm up the main blower fan.
As both fans and start at the same time and nothing else is happening I am thinking
the mother board is at fault.
Like you say, easy to replace and not to expensive and from the sound of the problem
I would guess that is a good starting place.
I have a spare board and whenever I have a problem I use it for trouble shooting.
If I replace it and get the same problem, then, I am off in search of what is really
causing the problem.
As a side note, the earlier problem with the gas valve could have also been a motherboard.
If the vent blower starts, then the igniter lights and then shuts down either the motherboard
did not sense igniter heat or it did and then did not send the signal to open the gas valve.
In your case it worked like it should but the valve did not open. It could have been a bad
igniter sensing circuit or a bad valve opening relay however. Just something to keep in mind.
Good luck with your problem.
Not a licensed furnace guy or anything, just have to do it all myself living as far out in the
boonies of northeast Montana as I do. You learn to do this stuff or freeze during the winter.

Check the air intake and exhaust output on the furnace.

If either is clogged, the furnace will start up then shut down.

Also -- how does your system dispose of condensate? Is there a
condensate pump? If it's not working, the system will start up then
shut down when it sense the condensate pump is not working.

When working projects without prior knowledge or experience I try to
use the following approach:
Log observations and my actions on paper
Do what is easy
Do what is cheap
Clean it
Take pictures before disassembly
Determine how it is supposed to work... this is where it gets serious!

This has been the prob with my Mom's gas furnace... the condensate
reservoir fills up and trips the float switch because the condensate pump
isn't working (or the drain line is frozen in my case). the fans run but
no gas, etc

Is there a thermostatic switch on the hot air manifold?

That would be the first thing to check. If not that, then I
would check the induced fan blower system that exhausts the
hot gasses.
You would want to make sure the flue pipe is clear, and
also the little tiny hole that is in the blower housing,

which is inside the nipple where the little usually rubber
hose connects. Many times that little hole will become
plugged and the pressure switch will fail to operate.
You can jump the float switch for a quick test.
You can also jump the pressure switch for a quick test,
but you have to start the furnace cycle first, let the exhaust
fan start running, and then jump the switch.
If you jump the pressure switch first, and then try to cycle the
furnace, it will see it as a bad pressure switch, and it will not
operate.
But in this case, the condensate reservoir is the more likely
culprit. That's a fairly common problem with those.

You're a little early for your unrelated to the group problem of the month. I
believe you have posted non-ham radio questions 4 times in as many months. Of
the tens of thousands of news groups, THIS is the best place to seek help on
gardening, HVAC, etc.? Have you found your solution yet?

If you don't care what others think about you, then your are going about this
the wrong way. You need to go to a group with a lot more traffic than this one.
Your odds of finding at least one "member" that doesn't mind encouraging off
topic posts will be greatly increased. I hear the porno groups are popular these
days. Wait, even better are the mp3 music news groups. If it's Hams you want,
the UK Ham group (uk.radio.amateur) is brimming with technically proficient
people just waiting to assist. That group gets a lot more posts each day than

```
this one.

This is fun, let's do it again next month.

He could do worse, being as I'm qualified to repair such
equipment on a professional basis.. I can fix all kinds
of things, not just radios. :)

With the massive flow of antenna articles I see these days,
it's was lucky he able to get a word in edgewise.. :|

And being as he did post about towers once, at least he's
not a total alien to this small celestial body within the
vast galaxy called usenet.

And he did say he tried to find the applicable groups,
but found no joy. :(

Of course, your informative post was quite valuable to this
group I'm sure. :/

Hummm..

Hi

Thanks for all the advice. And I have tried all those. I took the condensing fan blower out and cleaned out that housing behind it and re-siliconed it. It did have some gunk in there but not enough to cause a clog. But now that is clean and when I reinstalled it the exact same thing happened. What is troubling me is that even if the thermost wires are disconnected from that board what happens is both man blower and exhast blower simply are the only things that run. Instantly. No sequence of events eg blower starting, then ignigters starting then main blower after heat exchangers heats up. None of that. I jumped that float switch and those vacume hoses I sucked and blew through them and I can hear the switches working, but same thing happens, nothing happens with that honeywell smart valve, no gas. I checked all the intake air pipes and exhaust pipes, nothing clogging. While everything leads me to believe it is the board so I bought another for 80 dollars and will replace that board today. I will take a photo of the board and one by one replace those wired and connections and try that. I was hitting those relays on the board and still nothing.

Seems some are upset because of my posts of my antenna and my sauna and garden,,,, well coincedently enough I have in my basement the sauna and steam bath thing I also installed and it was that very night that me and the missis were steaming it up in the sauna and steam bath and I think maybe there was moisture in the air that evening as that was the evening it failed.

To answer a question about the lights, my friend's furnace has the idiot lights where it blinks signifying what has failed, mine has no lights on that board, I think mine was the model before his, mine is about ten years old. I am going to replace this main fan relay board and see if that solves the problem, I can return the board if the same problem remains and start replacing the next part after that until something works right. I replaced the thermostat with the old one and same problem.

Thanks for the advice and tips. As I have said, I know there is a lot of knowledge in this group, I have benefited from it before and will again, as my server doesn't have active newsgroups like HVAC or Furnace or any of the other crazy things I have asked about. Lots of knowledge here, thanks. And i cannot wait until someone asks a question about their furnace, or their sauna rocks, or their tower, or their garden,,, because I will be the first to answer.

Ok,

I changed the main fan board, and still the exact same condition happens.

Even though the thermost is off, even disconnected, as soon as I turn the main toggle switch for my furnace, both main blower fan and exhaust fans immediately begin and nothing else happens.

I just unplugged on leg from the high limit switch, then one leg from the low limit switch then both together

Same, nothing.
Any suggestions?

Thanks
73

I only just saw your post, but before you replace the timer board, check to see if there is a limit switch in the blower compartment, and see if there is a reset for it. If this doesn't work, connect a jumper across it and see if that works. If that doesn't do the trick, look for other limit switches and do the same for those. You may not need to replace the timer board after all.

Let us know what you find out please.

I only just saw your post this afternoon, but before you replace the timer board, check to see
if there is a limit switch in the blower compartment, and see if there is a reset for it. If this doesn't work, connect a jumper across it and see if that works. If that doesn't do the trick, look for other limit switches and do the same for those. You may not need to replace the timer board after all.

Let us know what you find out please.

Sorry about the previous duplicate posts, the first one came back as unavailable
when I tried to download it myself. That normally only happens when a post
expires, but I digress.

Anyway, short the 2 terminals on each limit switch - one switch at a time with
the other(s) connected normally. I would start with the blower limit switch.
That would be my best guess.

I believe this furnace was made by Heil. I'm out of it now, but I've installed,
(and repaired) more of their furnaces and air conditioners over the years than I
could count. They are my favorite make. They are the same furnaces that Sears
sells, and they also used to be sold under the "Tempstar" brand. That is if they
are, as I believe, made by Heil.

Best of luck,
Bob KB2ZGN

Normally, the blower motor and inducer blower should not start at the same time. I was thinking maybe you had the T-stat fan set to "on" and it was running when you called for heat, or maybe it was running due to a "power off during heat cycle" code. But in that case, the blower would run for appx 90 seconds, go off, and then the inducer fan would come on. This is usually a code "12" on a furnace with winky blinky error lights.

But there is another thing that can cause what you are seeing, and that would be an open solid state hi-limit control. If one of those goes open, the IFC "integrated furnace control" which is the board, will cut the 24 volts to the gas valve circuit and then energize the blower blower, and the induced draft blower. These will stay on until the SS hi-limit closes, and then the heat cycle will restart. So you may well have an open hi-limit switch. Test the two connections with an ohm meter. If the furnace is cold, the hi-limit should show continuity. If not, it's kaput. These are usually in series with the other limits, so check all of them. Some of the ones in series will

have little buttons you can press to reset.
A SS hi-limit does not have a reset button. It
should close back up on it's own after the furnace
cools down. But they can go kaput and stay open.
Some may have thermal fuse links also..

If the hi-limit shows open with an ohm meter,
jump the two wires going to it with a jumper.
If that was the culprit, the furnace should start it's
normal heat cycle, close the pressure switch, and
start the igniter.
You would then need to replace the hi-limit switch.
Don't use the jumper in normal service. EVER!
That is just for testing.

But! You would also want to make sure there is no
problem that is causing high exchanger temps before
calling it a day.
Those can be a dirty filter, failing fan motor,
bad cap to motor, motor running too low a speed,
dirty blower wheel, over firing of the burners
due to excess manifold pressure, or orifice size.
So at this point, I think I would be eyeballing
the limits and the SS hi-limit in particular.
That usually looks like a phenolic wafer board with
two terminals that is often inside the case behind
the IFC.
And don't be afraid to call a tech if you feel you
are getting in over your head. I'd hate to see
you burn your house down due to some overlooked
problem that is causing excess temps.

BTW, you should always diagnose a problem in an
orderly military manner. Don't buy parts until
they are proven bad. Throwing money at a problem
and hoping something sticks can often get expensive
and not cure the problem.
Same thing with cars... :/

Anyway, this gives you a bit more to ponder..

Was reading that.. Actually, that "the hi-limit" is usually
around the heat exchanger to the side of the burners..
Dunno why I said it was behind the IFC, which is usually
in the blower area.. :/ But there are other limits for
the blower too. Most of those have the little reset buttons,
and sometimes there can be one in the back side of the
blower that is hard to see. Most limits have blue wires
going to them I believe. They are all rigged up in series.
So if you see a pair of blue wires going back behind the
blower, there is a limit there mounted on the blower housing.

Bingo

You are absolutely right. There is a reset button hidden between those two terminals in the upper limit switch in that heat chamber.

Wow, nothing I read in my manuals said anything about that reset button. And I paid a technician to come in and diagnose what was wrong, he told me to clean out the condensing housing there, re-silicone that as that may be clogged up but it wasn't and I did that. He also told me he was 99% sure it was a failed board and for him to replace was 300 plus the board, I purchased a board for 80 and did it myself and dam, same problem existed. Now I can return the board (or keep it as it is newer board and allows me now for cooling delay where the old board didn't and the old board didn't have fuses on, the new one does) so newer board is improved but now have back up board so it wasn't the board at all. I paid for a licensed technician to come diagnose after I tried all componenets, and was wrong. Shit happens I guess. Turns out you are exactly right Bob about the limit switch causing both fans to run immediately. after resetting that little button (why didn't that service guy know there was a little reset button hidden in that unit). I bypassed that and must have had the other one closed because it is inline with the smart valve. Wow, what a learning experience.

Anyway, I know more about my furnace than most home owners now, so good learning experience for me and have about 100 dollars worth of extra spare parts incase it fails again.

Excellent advice as usual from you hams. Appreciate every one of your comments, suggestions, tips. I got it working and saved a few hundred dollars but now know more about it than before. A lot more. Very shocked that the licensed service technician furnace guy didn't simply try that reset button. The easiest fix in the world, yet missed it and he would have replaced the board and found the same problem exists then he would have kept trouble shooting and found the relay reset button like I did and charged the home owner a big amount and replaced the board for nothing. Should have been an easy reset fix. Now I know.

Thanks Hams,,, 73s and happy holidays.

Now if I read anyone having issues with their furnace similiar to mine, I am happy to offer advice. Big learning for me. Excellent. (but cost me about 100 bucks but shouldn't have cost me anything).

Thanks again

Excellent. Sorry I didn't see the thread sooner, it would have saved a lot of time and money. You will probably want to keep the board. Most places won't accept returns on electrical parts. It's too easy for someone to swap their defective part for the new one and try to return it. People try that more often than you would believe.

It's not surprising that the "technician" told you it was the timer board. Look at what it cost, and what he was going to charge for it. In most areas, there is no licensing or certification necessary at all for someone to repair furnaces. If someone presents you with an expensive repair estimate, always get a second opinion. It might be worth the price of a service call to discover that you really don't need it after all. Ask family, friends and neighbors who they use, how many times they had to call them, and were they satisfied.

Glad I could be of help.

Some of those boards cost silly $$$$$...Even wholesale price.
I always dread having to tell someone they need a new one,
because it's usually a pretty high bill, just because the
price of the part is so high from many of the manufacturer's.
It's usually the dinky fan relays that go TU if one actually
does go bad.
Some companies seems to be semi reasonable.. But some of the
biggest brands like Lennox, Trane, etc.. Ouch... Often around
$225-$250 wholesale just for the part.
You have to be licensed here, but even that doesn't mean the
guy isn't a crook..  :/
They have some companies here that are so big, and have so
much overhead, that they almost have to rip people off to
stay in business. I can think of one in particular here locally
that I hear lots of complaints about. They have a big monster
dispatch center that looks like Mission Control at NASA, lots
of overhead, loads of trucks, etc.. And they have expanded to
other cities in the state.
They rob nearly everyone they deal with.  :(

Where to aim the ol' spark-catcher???

"Hams love maps, map software, and map-plications! Here's an online applet to create a simple azimuthal-equisdistant map centered on any location you care to specify." -- ARRL Contest Update

The latest edition of the Update contains this link:

http://hp.vector.co.jp/authors/VA011609/azmeqdist_e/azmeqdist_e.html

The site allows for quite a few options. Click around and play. You can drag the geographic map center with your mouse and you'll see the LAT/LONG numbers change as you do. I see no azimuth ring around the outside but a clever fellow can label his printed-out map.

"Sal"
(KD6VKW)

PS: If, perchance, you don't know about the Windows "Print Screen" key and your ability to paste (and edit) the captured bitmap into the "Paint" program ... well, now you do. On Mac, use "Grab" for much the same thing.

Absolutely right.

I appreciate all the input, yes it would have cost me a lot and for what turned out to simply be a resetting of that limit switch.

Good part is that I learned my furnace mechanically inside and out. Only costs me about 100 and have a spare board now.

But after trying everything I could think of, after bypassing all the safeties and bypassing things I was just perplexed.

Thanks again

The only thing I wonder about is why it tripped the limit..
I'd keep an eye out on it for a while.. Make sure the fan
never quits running when it should be, doesn't start slowing
down from normal speed, filter clean, etc..
Of course, if there is some problem, it will just trip again,
and you might be able to get an idea what is causing it.

I've already listed most of the things that could cause that.
In the majority of cases, it's the blower motor going kaput.
Then again, maybe it was just a fluke.. @#$% happens sometimes..

I said before that I didn't want you to burn your house down,
but actually it's almost impossible with all the safety devices
those things have. So you really don't have much to worry about
if something does cause it to overheat in the future.

Hey, Thanks for the good advice.

I recently installed a sauna and spa on the same floor, it just happened to be that particular evening that the limit switch tripped when I had used those two units so I think I got a lot of humidity and heat in that basement. Then I also had to remove the intake pipe supplying the fresh air from outside because I had to move something else so that pipe was off and it was sucking in air from that room for combustion. Also, the heat supply ducting inspection plate had been removed from that room because I wanted to add some heat into that room. When I feel that intake area near the tripped limit switch, it is very warm. Now that I have re-connected everything it is cold. So maybe those scinarios had direct responsibility for tripping that limit switch. That is what I am thinking. I think too much heat in that chamber caused it to trip. Doing its job. Hasn't tripped yet after about 6 hours of operation on and off.

Thanks again

I find Google Earth much easier to use. Gives distance and heading. You
can also see the satellite pic of the country (if you're curious).

That was probably the problem. Shouldn't have been a severe overheat,
but maybe enough to push it slightly over the edge as far as the limit.
I doubt you will have any more problems if it's run OK so far.

I love Google Earth. I have it on my iMac in the house. In the shack, however, I usually can "hear" the monitor as I tune across the bands, so I normally keep it off.   I just installed GE here and it runs nicely (XP, 2.4 GHz, 1 GB).

I don't see the feature to do a range and bearing from Home.

Thanks again Hams

Really appreciate your advice here on this topic. I now know more about my furnace than the licenced quaified repair techinician who I paid to diagnose the problem. That is true because I took the couse HVAC engineering about 20 years ago and spent years doing heat lose heat gain caclulations for industry. But never knew there was a simple little dimple reset button in the stragest place. Dam.

Now I know and there is nothing on this unit I cannot repair myself. Servicing and cleaning is easy.

Sorry I upset a few of the hams, I know it is off topic however there is no groups on my server that are active, this one is so sorry I upset some hams with my off topic question but I know there is a lot of knowledge in this group,,, and I am thankful for that.

73s and happy holidays.

All Hands

Be advised that the TSA considers any tool longer than seven inches in any dimension to be a weapon and they will not allow it in the passenger compartment of a common carrier aircraft. In order to save my One Hundred Twenty Dollar crimper I had to send it to myself by FedEx go back through security and dammed near miss my flight. I was unaware of this rule so the crimper was in my Radio Carry On. I would not want any radio that I was responsible for to go in with the baggage because it would be unlikely to arrive at the destination in working condition. I guess I will have to buy one of those Air Transport Cases to hold all of my tools and pay the extra fifty bucks to check it with most airlines. Security Theater strikes again.

```

In GE, click Tools and select Ruler. Leave the Ruler dialogue box in Line mode. Put your pointer (which has changed to a square with cross hairs) on your starting location and click. Move your pointer to the destination and click again. The dialogue box will show the distance and heading.

Cheers,
John KD5YI

You might want to check with the good folks over at
rec.gardens.edible.
What I do is to leave the leaves on the garden untilled
as mulch.  In the spring I will roto-till them in.
Let them sit for a few weeks, then test the soil to
see if any amendments are needed.

Compost. It's one of the best "soil amendments" you can have. A composter can be built for a few dollars but you have to attend to it with moisture, aeration and/or tumbling. Google for "homemade composter" and see what others have built. Properly composted material will resemble ashes or dirt, depending on the texture of your source plants.

The leaves will eventually break down on their own and sort of "self-compost" but you can speed the process with a little work. Mix in the compost and it replaces some fertilizers.

Garden centers all sell soil test kits. The results of a test will suggest whether you need supplimental fertilizers.

Manure can be acidic and may do more harm than good. If you compost it, too, it will be less acidic.

Sal

As one other poster suggested, check with your local agri-support folks. I'm from northern NY, FN24, and moved straight west to MN, EN34. When you are this far north you need to know exactly what climate range you are in, and then assume it's a half point to a point worse. Then your plants will usually survive.

You are probably a fraction of a climate zone north of me unless you are tucked in between the ends of Erie and Ontario.

73

Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.2 2011/11/02 04:08:53
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/
d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team had decided to consider |
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. After a successful trial |
period (90 days, through early July 2009), we decided to adopt this |
change permanently. |

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

The breakdown of leaves is a dfferent process than that of making compost
and takes a lot longer. You should not add leaves to you soil but in time
the worms will eat it all up.

Use the leaves to make leaf ulch which you can then use on the surface, see
http://www.hereandthere.org/making-mulch/making-mulch-from-leaves.html

Charlie.

I'm posting this for a buddy of mine who can't get newsgroups on his
system..

This is an OLD mint portable battery pack, model number HB-506.  This is
for the HB-525 / 625 radios of the late 1960s.

http://www.ebay.com/itm/130609760136

go to ebay and copy and paste the item number if the link does not work

130609760136

Yes, thanks all hams, yes, excellent advice.

I don't want to put in a composting pile as I feel that might attract a lot of mice or animals as my neighbors have told me. I know the pile of leaves gets warm in the middle. One neighbor told me about nitrogen, my situation required nitrogen and the region here has a byproduct from our waste and they call it bio wastes and the farmers line up apparently for it. He said he can give me a couple pails but he says it is very potent or almost 95% nitrogen. And he says the ministry of environment wants to know about it and fill out a bunch of forms.
I like the idea of a composter, easy to do, looks managable. Thanks again hams for the great advice. I know it is off topic but as I said, I get a lot of good advice from this group, the gardening groups are not active or attached to my news server. Much appreciated.

73s and happy holidays

```

Turn it when it starts to get warm or you may end up with an ash pile.
Any green waste (no sticks) will feed it. I used neighbors' lawn
trimmings and leaves. I never needed any extra boosters. Only critters
you get is earthworms. Their poop is the fertilizer. I think the nitrate
may inhibit earthworms. Earthworm casting is the fertilizer you get from
a succesful compost situation. Build in on the ground.

I am using a whip antenna mounted on a metal patio cover. Results are good on 10 and 12 meters, and contacts have been made down to 40 meters. (Matches were not obtained on 15 or 30 meters) The whip is 8.5 ft long (a longer whip is under consideration). It is fed through an antenna tuner and about 25 feet of RG-58. I'm about to replace that with RG-8.

Any comments on how to hold down feedline losses. One suggestion is to use two parallel lengths of RG-8 so that half the current runs through each. Also, site geometry would allow open wire feed.

Possibilities?

Sorry, Parallel cables would give you twice the losses. Also, what it would do for matching will vary by frequency but not likely anything you want. Lower loss coax is always a good idea but with only 25 feet total your losses may not be enough to notice. Vertical antennas are usually at their best at 1/4 wave length long for the purpose of radiation. In practice, if you get it tuned up well enough to take power, it will work!

I have a 28 foot vertical antenna that sometimes outperfoms my 3 element beam. It is tuned with an SGC autotuner.

There is a lot of information on the internet for free, Google a bit and keep at it. I seem to enjoy working on antennas more than using them.

BTW, Check out the ARRL.NET site. There is a 10 meter contest in a
week or so that your antenna will around the world...

I use screen-door spring(s) at each end of my wire antennas to permit
tree/limb movement without stretching the antennas. You should be
able to buy such springs in several strengths at 'most any hardware
store (probably even WalMart or K-Mart) in the USA. If I think one
spring might not be strong enough for a particularly-heavy antenna,
I just parallel two springs.

Of course, the springs are between the antenna insulators and the
ropes used to pull/tighten the antennas.

If you do use weighted buckets, be sure to tie ANOTHER rope to the
bucket and a nearby limb so the bucket won't fall on someone's head
if the antenna rope or wire breaks!

As John mentioned, 25 feet of coax is too low of a loss to worry about especially below 30 Mhz. The other best bet is to use a remote antenna tuner at the antenna. A longer antenna should work much beter on 80 and 40 meters.

Dear Wayne (no call sign given): The use of "it" causes an ambiguity. If the antenna tuner is "at" the antenna feed point, then 25 feet of RG-58 running to the shack will contribute very little to the overall loss of the system.

A colleague has had success with an insulated wire on his roof fed in the middle with an auto-tuner. The coax from the tuner has several type 31 chokes to kill common mode and the coax itself contributes very little to the performance of the system.

On the other hand, such a short antenna as you are using (on the lower bands) fed with RG-58 from a tuner in the shack is expected to have significant losses. If this is the case, moving the tuner outside should be tried.

73,   Mac   N8TT

Taking this to mean that the ATU is at the tx end of the 25' of RG58...

It is challenging with that topology get get good antenna system
efficiency when the monopole is less than about 17% of a wavelength.
Working that backwards, your 2.6m whip is 17% of a wavelenght on 15m
wavelength or 20MHz.

The contributions to poor efficiency are feed line loss under standing
waves, ATU loss, and if the whip is magnetic stainless, conductor losses
in the whip.

RG8 will have lower losses, but the result will be a more challenging
load for the ATU and its losses will increase, consuming some of the
benefit.

You really need to take a system perspective because there is a complex
interaction of the system components.

>

Paralelling two cables reduces Zo to one half, but the matched loss per
metre is the same. The loss under standing waves depends on the actual
load impedance which you probably don't know.

>
> Possibilities?
>

A remote ATU, a longer monopole.

Owen

Yes, the wording is confusing. The antenna is fed with about 25 feet of RG-58 with the tuner next to the rig in the shack. The cable will be changed to RG-8 tomorrow assuming that the winds finally die down here in So Cal.

On 10 and 12 meters the performance is quite acceptable. I'm not the big signal on the band, but it works well.

I'm hoping to slightly lengthen the antenna and get performance from 17 to 10 meters. Since the tuner to antenna VSWR will be very high, I'm pondering ways of lowering the loss.

A separate loaded whip is used on 20 and 40 meters.

So far, the experiment has been good, and it is one of the few antenna configurations that meet the established requirements. (established by the xyl) :)

Thanks
Wayne

The OP seems to be doing what I did for many years, ie feed an endfed
monopole antenna (of undefined length) with coax, and force match it, as
required, at the shack end. [I believe it was you, Owen, who pointed out
my error in trying to use the graphs showing loss vs SWR when the coax
is electrically short (less than a wavelength.]

Although I now have a remote tuner at the antenna feedpoint, I can't say
I've noticed an outstanding improvement in performance (although, to be
honest, I really haven't really done a lot of operating since I
installed the tuner).

If you don't want use a remote tuner at the antenna feedpoint, the
impedance at the shack end of the coax will be the antenna feed
impedance, transformed by the length of the coax, and also altered by
the loss in the coax. Provided the shack-end tuner can be persuaded to
match the impedance seen looking into the coax, the system will work
tolerably well with low-loss coax.

It is obviously advantageous to use the lowest loss coax you can lay
your hands on. As, in cable TV systems, long coaxial trunk lines have
now been superseded by optical fibers, I would suggest that a cable TV
operator might be persuaded to donate some nice chunky coax (preferably
"as thick as a horse's prick", as one of my bosses once described it).
Failing that, just go for the best you can get.

   If its an autotuner, best place for it is at the base of the vertical.

Way too much time and money is being wasted in the change over from the rg58 coax. Even with a 20 to 1 SWR the rg-58 will loose about 3 db of signal due to the large mismatch. the rg-8 will still loose atleast 1 db. This 'big' gain of 2 db is hardly worth it. More time and money should be put into a beter antenna. Maybe one of the trap type verticals that is 30 or more feet tall. You gain by a beter radiation efficency and at the same time cut the loss in the coax due to the beter match. Even the screwdriver type antenna would probably be much beter. With that you get rid of the losses in the antenna tuner.

I'm about to replace that with RG-8.

Taking this to mean that the ATU is at the tx end of the 25' of RG58...

It is challenging with that topology get get good antenna system efficiency when the monopole is less than about 17% of a wavelength. Working that backwards, your 2.6m whip is 17% of a wavelenght on 15m wavelength or 20MHz.

The contributions to poor efficiency are feed line loss under standing waves, ATU loss, and if the whip is magnetic stainless, conductor losses in the whip.

RG8 will have lower losses, but the result will be a more challenging load for the ATU and its losses will increase, consuming some of the benefit.

You really need to take a system perspective because there is a complex interaction of the system components.

>
> Any comments on how to hold down feedline losses. One suggestion is to use two parallel lengths of RG-8 so that half the current runs through each. Also, site geometry would allow open wire feed.

Paralelling two cables reduces Zo to one half, but the matched loss per metre is the same. The loss under standing waves depends on the actual load impedance which you probably don't know.

>
> Possibilities?
>

A remote ATU, a longer monopole.

Owen
****
-
Thanks Owen. As usual, good information.
For clarification, there are two antennas. One is a bugcatcher type whip covering 40, 30, and 20. That part of the "farm" is working well. and requires no tuner.

The other is for 17 through 10 meters and is the one that will be a single short radiator with tuner in the shack. An 8 foot whip is currently used, but the max acceptable length will probably be in the 11 foot range.   A longer radiator (than about 11 feet) is not "permitted", and a remote ATU is possible, but not desired.   Feedline loss for this antenna was the subject of the original post.

Thanks again.
Wayne

The OP mentioned a 2.5m whip down to 40m. VSWR(50) of such a thing is likely to be around 1000 so your estimates of loss for VSWR(50) are not applicable to that scenario. (Estimating loss based on VSWR is prone to error in any event.)

An NEC model suggests that feedpoint Z might be something like 10-j800.
Taking that for example with 25' of RG58, line loss is more like 17dB.

RG213 is better, but it does not solve the fundamental problem that R at the feedpoint is very low, and a large current is required to deliver power. Large currents contribute to high loss in feedlines.

Owen

Go back and read what you wrote:

===
I am using a whip antenna mounted on a metal patio cover.  Results are
good
on 10 and 12 meters, and contacts have been made down to 40 meters.
(Matches were not obtained on 15 or 30 meters) The whip is 8.5 ft long
(a
longer whip is under consideration).  It is fed through an antenna tuner
and
about 25 feet of RG-58.  I'm about to replace that with RG-8.
===

No mention of loading coils, other antennas and you make specific
mention of using this antenna on 40m (QSOs offered as evidence,
notwithstanding that EIRP is probably very low due to extreme line loss
as calculated in another post).

If you can't express the scenario clearly, the advice you get is even
less reliable!

Owen

The whole point was that going from rg-58 to rg-8 or the rg-213 or lmr-400
would not make hardly any differant.  While the loss may be something like
17 db in the rg-58, it would still not be beter than 3 db going to another
type of  50 ohm coax.

You are right.  I should have simply asked "how does one lower real world
transmission line loss when the VSWR is high", and skipped the commentary.

Years ago I had put up a similar antenna to be able to get onto the
local 10M net. I then as you have tried to tune it up on other bands
after upgrading from Tech+ to General and got similar results to what
you have discribed. Changing the radiator to  5/8 wl on 10M improved
operation of the antenna not so noticably on 10M as it did the other
bands. Good luck, have fun and learn.

Jimmie

So far it has been fun. I've been able to check out the antenna on 10 and
12 and it works well. I need to fix a rig problem before 15 testing. 17 is
working, but propagation hasn't been good enough for much testing.

Tests on 20, 30, and 40 yielded qsos, but with low signal reports. Those
bands have been written off for the tuner/coax/whip. However, I'll try 20
again if I get a longer radiator up.

5/8WL on 10m is ~0.3 WL (> 1/4WL) on 20m so it will have an inductively reactive feedpoint impedance around 78+j200. A series capacitor of ~56 pf at the feedpoint on 20m should result in an SWR on the coax of ~1.5:1.

Something for consideration for lengthing the whip: Buy a 3 or 4 ft 3/8 inch aluminum rod from local hardware store and thread it on both ends with 3/8x24. Use a coupler nut to fit it to the bottom of the whip. I've used this technique with mobile antennas and seems to work fine.

Also, you mentioned the ability to use open wire/ladder line. Wonder if you considered ladder line to a 4:1 balun and then short coax to tuner? I'm not sure that presently with such a short run of coax to the patio you would gain much, but for longer runs, it would definitely be a consideration.

Thanks for the info Cecil. It turns out that a 10m 5/8 would be too long to meet the wife's "requirements".

I haven't gotten into describing the antenna "problem" in detail, but here is a synopsis:
Space is available for 2 verticals to be mounted on top of a metal patio cover, and they should not be prominently visible. That limits the total length of each to about 11-12 feet. A base mounted remote antenna tuner is not desired.

Band coverage is desired for 40 through 10 meter cw. One antenna, a 11 foot bugcatcher, is used on 40/30/20. The other antenna that is being pondered has a configuration of tuner/ 25 ft of coax/11 ft whip, tunable at least from 10 through 17 meters....thus the interest in low feedline loss.

With further consideration it appears that the loss in 25 ft of coax is not a game changer. Experimentation continues, and results are positive so far.

LOL......
Well, after 40 years with this one, I might as well stick with it.  BUT,
I'll never get married again.  I'll just find some woman I hate and buy her
a house.

I have one of those too. Not as nice condition though. It was used a lot back in
the day, but it still works, and even has an HB-525 still attached to it. I
checked to see if there was any interest in this item, and saw it took in
$129.26 just for the pack without radio or batteries. Wow.

Don't know about the first question.

Alternatives

o Hot glue filled heat shrink tubing. Readily available at my local pro electronics store.

o a drop of mixed 5 minute epoxy

o a large number of other things available at your LHS or FLAPS. Be creative.

tom
K0TAR

LHS - Local Hardware Store
FLAPS - Friendly Local Auto Parts Store

Hardware stores have slip on caps (of various sizes) that I used to get for my
elderly aunt's walker and canes.  I have found them to be satisfactory, but change
them often because they will deteriorate and begin to leak.

Thanks for the ideas.
The question was prompted because I don't want to take the antenna down for a check or repair, and I don't know how well my readily available materials hold up under UV and heat.

I'll mull this over a bit, and then charge ahead :)

> hold up under UV and heat.

How useful is it to have plastic tip caps on an antenna you cannot reach?

I could understand that you would want a spherical tip end to reduce
the risk of arcing, but it would need to be metallic and would not suffer
from UV or heat.

If the antenna is made of hollow aluminum tubing it keeps rain, snow and
insects out of the tube.

Heat shrink end caps. Thes hold up well in sun light and have glue on
the inside that melts when you apply heat..

Ah tube... I was thinking about steel rod with a pointy (and maybe
dangerous) end.

I recently came across some JB Weld Waterweld and Loctite repair putty. I
have used this two part hand moldable epoxy for various indoor projects and
have met with success on a number of occasions. I am now preparing to erect
a dipole and I am wondering how well this epoxy would work for the center/
end insulators? My main concerns are UV, weathering and of course
longitudinal strength. Anyone have experiences/ recommendations they can
share?

Thank you.

I'm not familiar with these specific products, but I know
from experience the standard JB Weld is conductive. Not a
good choice for repairing insulated parts.

I thought that one of the parts had some powdered steel or something in it.
Anyway....make a sample and test it in the microwave.

No, according to their website, standard JB Weld and Waterweld are
nonconductive.  I have some hardened Waterweld here that I just tested with
the ohmeter and there is no conductivity.  They do have a steel reinforced
one thought that would be conductive I suspect.

Why would I want to test this stuff in the microwave?

Dielectric losses.

Make sure you have a cup of water in there while you do it. But afterwards check the blob of material to make sure it stayed at room temperature.

Remember that testing with an ohm meter is testing at DC. RF wise, it might be a different story.

Regardless of matters of conductivity, insulators are cheap enough that they would be a better choice than repairing a broken insulator. I'd be very skeptical of the structural integrity of such a repair, especially if the break was not caused by impact. That would mean that the break was caused by structural stresses, and would likely recur.

Thanks to all. I decided not to use the Waterweld due to the uncertainties. I tried to use what coax seal I had left since Radio Shack no longer sells it and I lacked time to get more, so what coax seal didn't seal I covered with electrical tape followed by a couple of coats of liquid electrical tape.

I think my original question here was a little misleading. I really wasn't needing a support insulator, but a proper seal. I was building a folded gain dipole for 20 meters out of 300 ohm twin lead, so the ends had to be sealed as well as the two center places where the beams connect. Hard to explain, but I sealed as above. Hope it holds up.

Jayson

You can put several coats of "Liquid electrical tape" over the
connections. That's flexible and water proof.

Jeff

OK, good luck.

But, I was hoping to see someone microwave test the JB. Might do it myself,
just out of curiosity if I get tired of watching the squirrels run up and
down the tree out back :)

From time to time I've read about some interference, or deliberate jamming, of an amateur satellite.

My question is has anybody written a nice paper where using known orbital elements of the satellite and Doppler Shift to calculate a curve on the earth's surface where the source maybe located? I would think any issue with the satellite's transponder's frequency conversation, due to local oscillator frequency drift, can be corrected for by calibrating the link between two or more known stations. This I'm assuming would likely only work for linear transponders.

Since the satellites are in highly elliptical orbits the Doppler Shift would be different over several orbits. Then using multiple orbits these curves I think would tend to intersect, or nearly so, at one point. Additionally the time of signal acquisition and loss can be timed and compared to the projected ground foot print of the satellite coverage zone to help zero in on the source location.

Sorta. That's how the Transit (NAVSAT) satellite navigation system worked, but backwards. In the Transit system, the ground station measured the doppler shift from the satellites. In your case, you'll need to measure the doppler shift of the ground station from the satellite. That's going to be difficult because your ground station will have both the ground to satellite doppler, and the satellite to your receiver doppler to deal with simultaneously. Since both the postion of the satellite and your station is known, the 2nd doppler shift can be calculated. Note that the only part of the "S" curve that's really important is where the satellite passes overhead. A highly elliptical orbit will make that somewhat tricky.

The math to recover the first doppler shift involves an exercise in 3D spherical geometry, which is non-trivial. I'm not even sure I could still do the math. Sorry no software handy:

Correct. The "bent pipe" satellite transponder is the only one that will pass the uplink doppler shift. It won't work with a demodulate-remodulate repeater.

Yep, except that from 100 miles up, the "cocked hat" pattern formed by
the lines of position is going to be rather large. I don't have a
feel for the expected accuracy, but I'll guess(tm) that you'll be
lucky if you can locate anything within a mile radius.

Good luck.

Hi,

I would like to buy anything related to Icom 745/751 radios, parts,
too, even the radio itself
working or not.

Thank you.

Would you mind posting a link to one or more of the sites with the 'typical pictures' so I may get a complete picture of what you are referring to? You have piqued my curiosity. Thanks.

This is how the SARSATs calculated the position of 121.5MHz and 243 MHz
EPIRBs.

It should not be difficult to locate the source so accurately that you
could go to that position and hear the transmitter and locate it
using land-based direction finding.

However, this usually is not very practical. The interference comes
from countries with little amateur activity, and who wants to go there
for a fox-hunt (which you maybe cannot start right away, you have
to wait until the interfering transmitter is active again).

And then, what are you going to do once the source has been located?
The local authorities are probably not that interested in getting it
off the air...

Check eBay.

Don't know about the 745 but I see auctions for IC-735 parts or entire
735's for parts.

Can anyone direct me to the dimensions to build a six meter J-pole that is patterned after the Arrow Antenna two meter design that had the feed point at the bottom of one of the elements rather than at a point part way up the height of the matching stub.

The reason that I would like to use that design is that I would like to use Rigid Aluminum Conduit to build the antenna. There not being a lot of simple inexpensive fittings for Conduit the way there is for copper pipe a mechanically simpler design would be easier to build.

Replies are welcome on or off list. Let me say that I would rather not be subjected to any tirades about the inferiority of the J-pole approach or the superiority of some other antenna design. That does not mean that I am not open to suggestions for a better approach as long as it is civilly stated and I am spared the application of Rant Mode.

Just put up a 80 meter dipole today, but had some difficulty with two things: proper tying off of the lift/ support rope and proper tying off of the guys. When I say "support rope" here's what I mean: one side of the dipole was anchored high in a tree while the other from a 30' telephone pole. The tree had a pulley installed, so the "support rope" hangs down from there as well as the eye bolt from the telephone pole (support rope through the eye bolt). So, I'm not sure where or how to tie the support rope ends. Right now, on the tree side, I just have several turns around a low branch with a knot; basically the same with the telephone pole side. What is the proper way to secure the base of the supoort rope?

How do I tie the guy wires?

Thanks for any help.

It is a sad statement of the state of affairs when you feel a need to
compose a help request with such conditions, 40% of your post is setting
conditions on your would be helpers responses.

This is not unusualy, the posts can often can be paraphrased as "I have
got this really good idea, and I don't want to hear from anyone that it
is less than a really good idea... over".

Your 40% conditions is by no means a record, higher percentages have
been observed on QRZ and eHam, such high percentage as to make the whole
thing look like a troll rather than a genuine request for help.

My own view is that it helps to be a little humble when seeking help.

Owen

The 144/440 antenna can be found at:
<http://www.arrowantennas.com/inst/OSJ146440.pdf>
with dimensions included. You probably won't need the short element in the middle which seems to do something for 440Mhz operation.

Two ways to do this:

1. Plug the dimensions (in wavelengths) into an EZNec or 4NEC2 antenna model, and scale it for 52MHz.
2. Scale the antenna dimensions linearly from 146 to 52MHz and optimize with cut-n-try. The driven element is 1/4 wavelength long, and the parasitic element is 3/4 wavelength long.

Maybe, but the 3/4 wavelength element is going to end up about 15ft long, which is rather long for tubing without a top support. The "rigid" aluminum conduit is made to be bent to shape. I suspect this 15ft long tube might deform in the wind.

>Let me say that I would rather
>not be subjected to any tirades about the inferiority of the J-pole

Ok. I'll just ignore my experience with J-poles and pretend that they're suitable for your unstated purpose.

>That does
>not mean that I am not open to suggestions for a better approach as
>long as it is civilly stated and I am spared the application of Rant
>Mode.

Approach for what application and mounting? If you want an antenna with a rather high takeoff angle, an end fed antenna, such as the J-pole will send most of your RF towards the birds instead of the horizon. If you want an antenna with a radiating coax cable (by lacking a balun), the J-pole is quite appropriate. If you want an antenna that produces impressive cloverleaf horizontal gain patterns when side mounted on a tower, the J-pole is the hot ticket. The

J-pole does have one big advantage. It was originally called a Zepp antenna, after the Zepplin airship, where the antenna was suspended downward. Because the low voltage point is at the base of the antenna, there would be no sparks to ignite the hydrogen gas. However, if you don't plan on flying your j-pole on a Zepplin, this advantage might not be very useful.
<http://en.wikipedia.org/wiki/J-pole_antenna> (first paragraph)

Please feel free to offer undying praise and monetary renumeration for the advice. I'm always open to being paid. There are probably better designs but since you've already decided on a J-pole, it's probably futile to suggest alternatives. Besides, it might precipitate a debate or arguement. Oddly, I learn more from such debates and arguments, than from pontifications.

5/8 wave 6m ground plane:
<http://802.11junk.com/jeffl/antennas/gnd-plane-02/index.html>
5/8 + 5/8 wave 6m ground plane:
<http://802.11junk.com/jeffl/antennas/gnd-plane-05/index.html>

I would normally offer to build you a NEC2 model of your proposed antenna, but since I don't know what diameter aluminum tubing you have in mind, and since it's 1:30AM, I'll pass for tonite.

Certainly not a rant but a question about the question:

Is your reason for this approach mainly your access to beaucoup aluminum conduit? I ask because I'm a j-pole fan and I've built dozens of them, including three for 6m using copper pipe and one 6m from window line. The feed is less than 7 inches from the bottom of the active portion of the 6m version.

Using your conduit, you might employ the "standard" j-pole design and bolt the segments together, placing wooden dowels inside your conduit ends to resist crushing forces. Am I striking a chord, yet?

A brace near the top of the stub section would likely be required to prevent rotation where the bottom of the "j" attaches to the main section. You might be well-served to wrap the bottom of the "j" with a tight spiral of mesh sleeve (like the braid-only of some unneeded coax) and clamp the ends. This would help mitigate the electrical consequences of a bad joint or two. Alternatively, bridge (jumper) the individual joints.

But see http://www.wagnercompanies.com/cast_aluminum.aspx , where a single

3/4 - inch tee or elbow is about $7.00. Do-able?

Note, my 6m copper j-poles are all 3/4 - inch material except the top three feet of of the long section. I tried using all 1/2 - inch copper once but that build was so wobbly that I immediately took it apart. (It's about 13 feet tall.)

Some of my j-poles have benefitted from having a capacitor from the feed connector center pin over to the the long side, in lieu of a straight piece of wire. I use one whenever the VSWR is mid-band but above 1:1. No science to it; I just tried a few around 100pF and SHAZAM! I was inspired by the capacitive feed in a gamma match.

Happy brewing.

Some people use gravity in the form of a bucket with rocks or scrap
concrete. It takes up slack (or pays out) as dictated the wind or ice load
on the antenna.

>
> How do I tie the guy wires?

Clarify guy wires, please. I have three dipoles, none with guy wires.

Content-Type: text/plain; charset=ISO-8859-1

I have finished two tutorials on noise.

the first one is here:

http://www.fourier-series.com/Noise/index.html

This covers thermal noise, and contains several interactive flash programs. included is insight into the thermal noise equation, rms voltage calculations, examples of correlation and how independent (uncorrelated) noise adds together. All the programs have extensive audio explanations.

The second one is here:

http://www.fourier-series.com/Noise/NoiseFigure.html

This covers The basic noise model of an amplifier. Spectrum analyzer representations of input signal and noise and output signal and noise are presented with interactive features to allow the user to modify signal levels, gain and noise figures of the amplifier. A full explanation of the noise factor model and derivation of Friis formula using interactive programs and audio explanations are provided.

Yes. Look for papers on the Argos system (that's what they use for tracking things like buoys, etc.).

Here's some starting points:
3 papers by Levanon, et. al.
1985 Random Error in ARGOS and SARSAT Satellite Positioning Systems
1984 Theoretical Bounds on Random Errors in Satellite Doppler Navigation
1983 Angle-Independent Doppler Velocity Measurement

More recently
2007 Amiri & Mehdipour, "Accurate Doppler Frequency Shift Estimation for any Satellite Orbit"
2008 Amar & Weiss, "Localization of Narrowband Radio Emitters Based on Doppler Frequency Shifts"

I would think any issue with

> the satellite's transponder's frequency conversation, due to local oscillator frequency drift, can be corrected for by calibrating the link between two or more known stations. This I'm assuming would likely only work for linear transponders.

Actually, you don't even need that. If you think about it, what you are trying to do is do a sort of curve fit where the unknowns are the 6 orbital elements and the frequency of the transmitter.

Simple techniques (like those you'll find in the Satellite Experimenter's Handbook and similar works) tend to focus on things like determining the inflection point of the Doppler curve, which tells you the point of closest approach, and then relating that to figure out the orbit (or position of the receiver/transmitter).

before the advent of the computational horsepower, analytical techniques like this were popular. You could do fixes and orbit determination with a stopwatch and slide rule.

Much like doing Celestial Navigation using Nautical Almanac and sight reduction tables vs using a computer.

These days, iterative approaches are more useful, and have the advantage that you can weight the individual observations by their SNR, for instance.

>
>
>
> Since the satellites are in highly elliptical orbits the Doppler Shift would
> be different over several orbits. Then using multiple orbits these curves I
> think would tend to intersect, or nearly so, at one point.

Yes. It depends on the orbit. Some are more useful than others, i.e. the classic 4 day repeat frozen orbit only gives you half a dozen different paths over any given point on the surface.

Additionally the

> time of signal acquisition and loss can be timed and compared to the
> projected ground foot print of the satellite coverage zone to help zero in
> on the source location.

It's fairly straightforward, and if you think in terms of iterative solutions, all you really need is a decent goal-seeker/optimizer engine tied to a orbit simulator. There's a variety of Matlab/Octave packages out there that do the orbit mechanics, and likewise, there's optimizer engines.

For that matter, doing the orbital stuff yourself isn't that hard with matlab/octave/mathematica or even C, BASIC, or PASCAL. Especially if you don't need gnat's eyelash precision. Take a look at the MIT OpenCourseWare offering for 16.07 Dynamics Fall 2008 Version 2.0 by Widnall and Peraire.. Specifically Lectures 15 and 16

T.S. Kelso's SGP from the celestrak.com website is a defacto standard orbit propagator. There's tons of implementations out there in pretty much any language you want.

Because they're selling wire for antennas, which is supposed to be
hard-drawn?

It's an absolute bugger to get 6 trifilar turns of
> hard drawn #14 wire onto a 1.5" OD toroid. It would be much easier,

For coils, as you note, you want soft annealed. If your core is big
enough, you can use ordinary THHN house wire.

Actually, you really need to see as much of the curve as possible.
Sure, just knowing point of closes approach (center of the S) is
commonly used in navigation solutions, but seeing the whole curve lets
you take out more of the unknowns.

One assumption is that the frequency of the oscillator is "reasonably"
stable over the observation time (100-1000 seconds for most LEO) so that
the frequency measurements have low variance, and that the drift is
small. Crummy RC oscillator with tons of phase noise wouldn't help.

160km is VERY low for an orbit (that's Phoebus-Grunt kind of territory)
  ISS is low (350-400 km) and has significant effects from drag. Most
LEO are at 600km and above.

Locating to within a mile should be straightforward. ARGOS regularly
gives positions of wildlife trackers and such to about 500m kinds of
accuracy.

Owen

I apologize for coming across as arrogant. I didn't mean to.

Perhaps it would help to know that I was looking at the J-pole as a transportable antenna that would be used when the operating position is down in between buildings, ridges, mountains, etc. I did look at the online patterns for a J-pole. When I used a diamond ground plane under those conditions the results were less than satisfactory. The intent is to get the signals up out of the hole. The aluminum conduit was because it is much lighter than copper pipe and far less expensive at present pricing. I may want to replicate the antenna several times if it happens to overcome the problem for the purpose of reliable communications outside of simplex two meter range without limiting the operator pool to general and above licensees. Also there are several places were we could use six meter APRS to collect data from, for just example, a temporary stream gauge by installing the gauge in the time between a flash flood watch and any subsequent flash flood warning. Obviously the temporary gauging point may well contribute to the decision as to whether and when to issue the warning. I was thinking to use rigid aluminum conduit because of the availability of both compression and threaded couplings. I intended to test which coupling technique would stand the most bending force on the upper portion of the antenna. I already guessed that the antenna might need to be guyed but I wanted to try whether using a one inch or even one and a quarter inch nominal size would avoid the need for that. Since the Arrow Antenna design is fed at the bottom of the shorter matching stub I thought it might be easier to transport and deploy without damaging it. As for keeping the stub in line with the radiator I had envisioned a short piece of 5/8" fiberglass U channel with two stainless steel pipe clamps as being robust enough to withstand repeated handling. The three quarter wavelength portion of the antenna would be fashioned into three nearly equal sized sections for ease of transport.

I have constructed a dual half wave collinear J-pole using copper pipe. It had given me much better empirical performance than the borrowed ground plane that I had used before it. If I could get the needed range out of the simple J-pole I was next going to work on the physical challenge of building another collinear dual half wave for six meters were the second have wave could be added readily for use when the antenna would not be located below local horizon.

If you have not found anything by now, you may go here for a 2 meter
version. Then divide the 150 mhz frequency by the 50 mhz frequency and get
a number near 3.   Then multiply ALL the dimensions by that number. That is
the lengths, diameter of the elements and spacing.

All hands

Let me start over. I want a transportable, six meter, vertically polarized antenna. The parts have to be readily assembled & disassembled. I would like it to have a somewhat higher than normally attempted radiation pattern for use between buildings, hills, ridges... [I had thought that a J-pole might be a good compromise instead of antennas with a more horizontal gain pattern.] It would be really golden if the adding of additional parts would change the pattern back towards the horizontal to use the antenna when it is located above local horizon. Parts should be short enough to fit in the foot well of the back seat of an ordinary sedan. It's a stretch but If it did not need guying that would contribute to ease of deployment especially in an urban operating location were the anchoring possibilities for guy lines may be limited. [I'm trying to devise an X frame tripod. It would be made out of fiberglass structural channel in order to lower the weight of the tripod assembly but that is not an antenna design problem.] I may need the antenna to be elevated when operating near pedestrian traffic to reduce the risk of RF contact or excessive exposure. Shielding the feed point from physical damage; such as by having it inside a piece of Box channel would be quite desirable. I'll leave it there and see what folks can think of that might work.

Tom,

The clever thing with the Arrow implementation is its dual band version where it is mechanically elegant. Does it lend itself to scaling up by near three times?

It isn't clear that you wanted a dual band version, though there are hints.

If you are looking for a single band antenna as implied in the subject...

As you have noted, the total height of the J pole for 6m is a potential issue.

You could look at it as essentially an end fed half wave with a rather large impedance matching device (~1.5m).

There are other more compact ways to impedance match an end fed half wave. The question for you is whether you can devise a robust implementation.

Is there advantage in using aluminium tube over wire? Well, obviously the wire needs support, but perhaps a telescoping fibreglass pole and wire with a matching network in a PVC box is another robust option.

Keep in mind that end feeding a half wave reduces the common mode current flowing to the feedline, the feed point voltage is highest at exactly a half wave. You might find a slightly shorter radiator to deliver most of the 'ground independent' feed, but with slightly less demands on the voltage rating of the matching network. It may be prudent to make your matching network adjustable to provide for locations where proximity to other things changes the tuning.

I said fibreglass (meaning literally glass reinforced plastic), and that doesn't include graphite or carbon fibre. A lot of these fishing poles are now made from graphite, and that introduces potential for loss.

BTW, I am not sure that your 'design' of the pattern is all that sound, however real antennas near lossy soil just don't have very low angle major lobes... so what you want happens for probably any low makeshift antenna.

Owen

Tom,
how concerned are you about the "match"? What length of coax are you
feeding it with? Do you care if the coax radiates? What bandwidth do
you need? (fat elements have broader bandwidth, for instance). How
rugged does it need to be?

You're looking at something with an overall length around 3 meters/10 feet?

If the j-pole is being done so you have a mechanical support, there are
other ways to approach the problem. I assume you want something that is
"feedline comes out at the bottom", so why not something like a dipole
with the feedline going up inside the bottom half of the dipole? You'd
need something mechanically strong enough to hold the two pieces of
aluminum together that's an insulator. Hose clamps would work to both
make the wiring connection and hold the tubing to the insulator. (I'd
look at a piece of fiberglass or plastic rod of appropriate diameter.)
Since you want to use conduit kinds of things, what about using standard
plastic electrical things. Perhaps a plastic conduit outlet body?
(Cantex PVC conduit body, type C, 1/2" hub, Grainger part #4FYP5, about $5)

Just screw the threaded end of the conduit into the body and you're
done. (If you get the stuff with a removable coupling, especially easy..
10ft stick, saw it in half, and you're almost done)

Do you have test equipment for tuning? Or are you looking for a cookbook design that you can just build and know it will work as long as the dimensions match the recipe?

>
> I have constructed a dual half wave collinear J-pole using copper pipe. =A0It had given me much better empirical performance than the borrowed ground plane that I had used before it. =A0If I could get the needed range out of the simple J-pole I was next going to work on the physical challenge of building another collinear dual half wave for six meters were the second have wave could be added readily for use when the antenna would not be located below local horizon.
> --
> Tom Horne, W3TDH

The love-hate relationship with J-poles has been pretty well documented over the years here on r.r.a.a. My feeling is that you can resolve that pretty well by decoupling the antenna from the feedline, and also from other nearby conductors. That's something you want to do with any antenna, at least where you want to have consistent, reliable performance in the face of differing feedline and antenna-support installations. One of the implications here is that you'll have a non-conductive support for the antenna. You should be able to get pretty reliable feedline decoupling with a choke in the feedline where it drops below the antenna, and another a quarter wave below that. For narrow-band operation (say operation in a band less than 1MHz wide at 50MHz), I'm partial to tuned chokes: a small coil of coax bridged by a capacitor to resonate it at the operating frequency. That's obviously not the only way to do it, but done right, it can give you quite a high impedance in series with the line while adding negligible additional loss due to the slightly longer feedline.

Since a J-pole is nominally 3/4 wave long, at 6 meters wavelength that implies something roughly 4.5 meters, or about 14 feet, long. I guess you can come up with some arrangement of pipes that will fit across the back seat of your car that you can put together to get what you want, maybe four nominally 1/4 wave sections. I wonder, though, if it wouldn't be easier to use telescoping sections of fiberglass (or similar reasonably stiff mast material) that would take you up to where the top of the antenna needs to be, and then just use a wire antenna. Then if there happens to be a natural way to hang the antenna (e.g. from a line tossed over a tree limb), you don't need to bother with setting up any mast + support.

As far as exact dimensions of the antenna itself, given all the good antenna analysis programs out there, I consider that the easy part, but dependent on just how you elect to make it: wire or sections of conductive tubing, and just how you will feed the antenna (tapped up the shorted quarter wave bottom section, or connected to the open bottom of the quarter wave). Pick a mechanical arrangement that works for you, then use a program to come close to the required feed arrangement and details of the element lengths and spacing, then build/ measure/trim to get what you want -- if you accept that anything below a 1.5:1 SWR works well, then you will probably have little if any trimming to do, assuming you modeled it accurately.

Cheers,
Tom

Hi all. My name y Alfred and I am new in this newsgroup.

Would you help me on how to demostrate equations 1 and 2 in page 9 of:Severns article; "Measurement Of Soil Electrical Parameters At HF" in http://www.antennasbyn6lf.com/files/ground_parameter_measurements_2.pdf

Thank you very much in advance.

Al

There is table of measured values for R and X on page 10.

Just plug them into the formulas on page 9 and see if you come up with the same answer for the equations in (1) and (2)

For R = 129 and X = -134

R^2 = 16641
X^2 = 17956
R^2 + X^2 = 34597
R/(R^2 + X^2) = 129/(16641 + 17956) = 129/34597 = 0.0037286
8.84 * 0.0037286 = 0.032961
0.032961 / 7.41 = 0.0044482

Side Note: in the 25 years I worked in the aerospace industry in Southern California, I ended up chasing Rudy back and forth across several employers. I finally had the pleasure of meeting him face to face around 1987.

One of the more interesting things he told me, "When doing your resume, highlight your accomplishments and gloss over the aberrations."

Jeff

Regarding the higher than normal angle request, either

1) make it fairly short so as to approximate an isotropic radiator

2) make it a significant amount longer than a normal J pole so you get
lobes above the horizon. You will need to model this for each concrete
or natural canyon you expect to be in.

And then think a lot more. Possibly a different solution is better.
Different band to start with. I don't know, just trying to stir up your
thinking.

Basically, however you have to, or can. There's not just 'one way' to
do it, it's whatever 'fits' your particular situation. If there's
much wind, and if using trees for supports (for example), it's a good
idea to 'allow' for some movement (as Sal said). A bucket of rocks, a
bungee cord, or tarp strap can work.

> Just put up a 80 meter dipole today, but had some difficulty with two things: proper tying off of the lift/ support rope and proper tying off of the guys. When I say "support rope" here's what I mean: one side of the dipole was anchored high in a tree while the other from a 30' telephone pole. The tree had a pulley installed, so the "support rope" hangs down from there as well as the eye bolt from the telephone pole (support rope through the eye bolt). So, I'm not sure where or how to tie the support rope ends. Right now, on the tree side, I just have several turns around a low branch with a knot; basically the same with the telephone pole side. What is the proper way to secure the base of the supoort rope?
>
> How do I tie the guy wires?
>
> Thanks for any help.

I use polyester dacron antenna rope. Guy wires are impractical for your application. The dacron will try to untie itself, so flatten the knot with some PVC tape to keep it from unraveling. The tree end needs a short rope with a pulley, and a counterweight on your main antenna rope. Who owns the utility pole?

Hey OM:

I see you has 2 postings here both referring to guy.

At work on the great lakes shipping my foreman always called me guy.
He would say hey guy do this or that. So my question are those my
wires?
That you call guy?
I would use guy ropes rather than guy wire. although you can use wire
but you better has broken it up into lots of pieces.
so they doesn't resonate on the band you are operating on.

I know, off topic but I do get good advice from this group. I will take the mud slinging,,, hope it is mixed in with your regular good information.

I have a back yard garden, I live in Southern Ontario Canada. I roto till it and we grow vegetables like tomato, peppers,

My friends were telling me I should mix in some leaves, my garden is about 20 feet by 20 feet.

I collected about 50 big bags of grinded up leaves and roto tilled them all into my garden. Very light and fluffy now and soft and full of broken down leaves, mostly Maple Leafs and some other varieties.

My question is what should I do? Should I mix in manuer? or furtalizer? Should I do something with this mixture now? Will it be ok on its own after a few years ? will these leaves breakdown on their own? should I put more leaves in? I think 50 bags is a lot.

Any advice or tips is much appreciated. Thank you 73s

Agilen't AppCad can be a convenient tool for one-off calcs.

Nevertheless, there is value in see the results of measurement as you make
them, it helps to minimise the chance of leaving the task with errored
data.

Owen

I have convinced myself of nothing. Hence, my questions here.

I measured the coupler several years ago:

Narda Dual Directional Coupler...

435 MHz

Forward direction:
Coupling = -33.1 dB
Directivity = -56.8 dB

reverse direction:
Coupling = -33.5 dB
Directivity = -74.7 dB

The manual for the Fluke generator says it is 50 ohms output Z. I used
your Line Loss Calculator to find that my 2.4m coax is 50-j0.1 and
0.671dB loss.

Nice numbers, but I don't know what to do with them.

I understand very little.

The Fluke gen feeds the Narda dual directional coupler. The coupler output has the 94 inches of RG-142B/U attached. The coax has all the ferrite cores in my possession slipped onto it to moderate common mode current. The vector voltmeter A input is attached to the forward coupler sampling port and the voltmeter B input is attached to the reverse coupler sampling port.

I put the best short circuit I can muster on the far end of the coax and set the vector voltmeter to read 180 degrees. I record the A and B voltage inputs.

I put the antenna on the far end of the coax. I read the A and B voltages and the angle between them. I use Excel to calculate the results as indicated in the HP AN-77 app note.

I am aware of the common mode current problems and I do everything I can to minimize them. I don't know if I am successful, but I test the effectiveness of my efforts by running my hand up and down the coax and watching the voltmeter. I haven't been able to get all variation out, but some of the variation is due to my hand proximity to the antenna itself.

Back to you.

John

Hi, Jeff -

Yeah, that's what I'm trying to learn by my questions.

Obviously, the antenna can't be sitting in front of the test equipment
so I'm trying to find a way to minimize proximity effects.

I should have used a different subject for the post, I think.

Yeah, well, sometimes I get turned around in my quests and lose my way.

It is the antenna characteristics I am after. What I want to know is, do I need to know the transmission line characteristics which I use during the test in order to modify my test results to show the true antenna impedance?

What I want to do is build an antenna based on its radiation characteristics (as shown with EZNEC) and then measure its impedance (at the end of a few inches of parallel conductors) so that I can put in a matching network to give my source what it wants.

John

The problem is that whilst putting the unknown right at the instrument might solve some problems, it creates others, particularly when the unknown is an antenna system.

>>
>> So unless you know how to work backwards from the measure you get to

Well, you can work backwards as I explained, though again at the expense of some uncertainty (error).

...
> Obviously, the antenna can't be sitting in front of the test equipment
> so I'm trying to find a way to minimize proximity effects.

Don't overlook that the reference plane need not necessarily at the end of the directional coupler, it could be anywhere that you can conveniently or inconveniently apply the calibration s/c (eg at the antenna connector for flange as appropriate).

Try this on the bench with a substantial length of coax to the reference plane, and measure a 25 ohm load (pair of 50 ohm terms on a Tee). The reference plane is determined by where you apply the calibration s/c.

It was common practice using slotted lines to make such measurements with the slotted line a long way from the reference point, which might be quite close to the antenna, possibly a s/c applied at the antenna flange, or on a W/G switch near the antenna.

BTW, you have read the AN, and noted no doubt the issue with error due to the probes loading the test circuit. I would not obsess too much over perfection unless you are prepared to go to great lengths to try and allocate the errors and obtain a better result.

My mention of the common mode current path is very relevant.

You have test equipment that is 'not-balanced' and a load that is balanced
or more likely 'not-prefectly-balanced' in a different way. That is likely
(certain) to cause common mode current, which means the common mode current
path directly participates in radiation, making the antenna different to
your design.

AHA! I think this is the answer I was needing. So, if I short the end of the coax and calibrate my vector voltmeter I can then believe the voltmeter when it says my load is a certain impedance?

I don't know were I got the idea that I had to have the coax characteristics to be used to modify the readings for accuracy.

Okay. I'll do that as soon as I can find the instruments. They are somewhere around here.

I don't obsess. I'm usually happy with errors of less than 1.5 to 1 (depending on circumstances, of course).

Thanks, Owen.

Ok, be aware that sometimes that impedance is gauranteed to less than
full output.

If it is 50+j0, then your Vf reading should not change in magnitude with
load variation. If it does change, you have to factor it into the calcs
as in the AN.

> your Line Loss Calculator to find that my 2.4m coax is 50-j0.1 and
> 0.671dB loss.

Since it seems you are applying the cal short at the load end of that
line section, then its loss is not so important (so long as it is
stable).

Ok, that sounds fine. If find it helps to measure something that is
known. Do you have a pair of 50 ohm terms and a T that you can measure
and convince yourself that it is working.

>

Ok, but it remains a potential problem.

Owen

Yes, I am aware of that problem. Perhaps I will build a current pick-up
loop and run it up and down the coax. I can use the sensitive input of
the vector voltmeter or maybe my Boonton RF voltmeter. I can then try to
minimize the common mode current.

Okay! This is another answer for which I was hoping. This simplifies everything.

Thanks again, Owen.

John

Surely the antenna will have some means of adjustment ie gamma match,
and since you know that if the electrical length of cable equals a
number of half waves, adjusting the antenna to show minimum VSWR at

generator end, achieves your goal...

I just looked back at some of my data and I see that the Vf changes slightly with some loads. However, this variation is used in my Excel spreadsheet to calculate the results. All is according to the HP app note.

Like I said. He doesn't like new results. Ever.

And if you provide evidence that he doesn't like, such as spacecraft
comm results that will likely not be what he likes, he will dispute it
and point back to the deprecated experiments.

It never ends. He is the ultimate troll.

Ok, the ultimate troll isn't him, it's another that hasn't shown up here
lately, but he's very close.

tom

I am looking for the new result.

Astronomers ASSUME. I do not know why.

In today's physics is opinion that we can detect the angular motion (Sagnac
effect) but it is impossible to detect the linear motion.
Who and when deprecated the famous null result?

Earth's rotation is about 465.1 m/s
Say the average frequency of visible light is 500THz

doppler shift is (Vr/C)*F = (465/ 3 * 10^8)*500 * 10^12 = 7.75 10^8Hz
So to see the shift you will need to be able to observe your light

frequency to an accuracy of about 0.00015%. Which would have been
impossible for Arago.

Of course the above figures are only true for light coming directly at
the observer ie on the horizon, so for other angles there is a Cos Theta
term to reduce the effect even more (to zero directly overhead).

Jeff

Dear John S: My comment of a few days ago was written under the assumption that you wished to know the characteristics of the TL. It has developed that you wish to measure the impedance of an antenna at the end of a piece of coax.

The procedures for removing the effects of a fixture, which I expect to be in the AN and require a short, an open, and a known load, may also be applied to a piece of coax. The result is the ability to remove the presence of the coax and be left with the antenna's impedance.

I do this in an automated way with the "calibration" feature of the AM4170. One scans a span of frequencies three times storing information about what the coax looks like with a short, an open, and (usually) 50 ohms at the far end. This takes some time depending on the size of the frequency span and the step size. The stored numbers (stored in a very inexpensive, tiny computer) are then used automatically to calculate (over the same span) the actual Z at the end of the coax.

Doing this procedure by hand, which I have done using the numbers measured by a GR bridge, is labor intensive. Before the advent in 1972 of the HP35, it was real pain. One did not use very many frequencies! It appears that you are interested in only one frequency.

Comments about choking common mode are right on target. Owen Duffy is one of the good guys.

73,   Mac   N8TT

P.S. Do you have a call sign?

Yes, I know. Sorry for the misleading subject line. I should have presented my query differently.

"In 1818 Arago found that the refraction of a prism for star light was the
same for light incident in the direction of the earth's orbital velocity v
as for that coming in the opposite direction".

The orbital speed is about 30 km/s. Todays radio methods are adequate for
0.5 and for 30.

The rotational speed was too small for everybody till 1925. In this year the
Michelson and Gale detected the Earth's rotation.. But nobody detect the
orbital speed.

The same is with the spacecrafts. The diurnal effect is confirmed. I am
looking for the annual effect.

Is a current balun or line isolator effective in limiting common mode current from the outside of a coaxial feed line when the antenna is a two meter & seventy centimeter dual band vertical? What sort of line isolation would be best practice for keeping current off of the outside of the coax shield?

Yes, for current balun; not sure exactly what you mean by "line isolator"; it appears to be a choke, maybe just another name for choke balun. Let me be on that.

You have some easy ways to make your own current balun, which might be called a choke balun.

(1) Slide a couple dozen Mix 43 ferrite cores over the coax and secure them to the coax close to the antenna. I say Mix 43 because it's pretty common. Mix 31, 43, 44 and 46 are suitable for 2m choking. Mix 61 covers 440 but not 2m. See:
http://www.fair-rite.com/newfair/pdf/CUP%20Paper.pdf for one company's view of things.

(2) Wind a section of the coax (again, close to the antenna) into a fairly tight coil of three to six turns on a cylindrical form. There are many opinions regarding size and number of turns if you search the web.

(3) Some advice would have you wind a few turns on a ferrite toroid but it would have be with a short section of odd, small diameter coax, since RG-8,

RG-58 can't be bent that tightly.

As to "best practice," that, sir, is far too risky to declare in a newsgroup. (If I had a few thousand dollars more in test equipment, I might risk an opinion.)

I will say that if you can manhandle the line -- grasping, waving, wiggling -- and you see the VSWR changing, it's possible you've not gotten it right, yet.

> outside of the coax shield?

Tom,

I published a design for a common mode choke which had moderate choking impedance from 50Mhz to 150MHz, see http://vk1od.net/balun/G1-1-FT140-61/ . It uses four turns of coax on a 1.4" #61 toroid, and common mode impedance data is shown.

Most manufactured products and most ham designs do not include predicted or measured choking impedance data which is most often the key parameter in selecting a device. If you don't have that, you are guessing.

The design mentioned above might be adapted for 130 - 480MHz by taking a turn off, but I would be guessing. Without modelling and measuring, it is just a guess.

Whilst I have explored the W2DU style baluns on HF, I don't have any designs that are intended for your application. I am sure there would be viable designs for low power. A string of suitable clipons might be viable (if more expensive).

Owen

I have an auto tuner whose specs for the output are:
"10 to 250 ohms"
Does that have any useful information other than perhaps the R part of R+j.

That's not particularly comprehensive information, since it doesn't say whether it's R, or |Z| that it's describing, and doesn't say what frequency range this spec might apply to. It's likely that any auto-tuner (or any manual one!) will have different matching ranges on different bands.

This spec *might* mean "This tuner will successfully match most loads within a 5:1 SWR range, on most of its bands, most of the time."

Or, it might mean much less than that.

You could ask the manufacturer for a full specification on the actual impedances that can be matched on various bands (e.g. a set of Smith charts). They may or may not be able to provide them.

If you know what the switchable reactances inside the tuner are, and what the switching topology is (most likely a bidirectional "L" but it might not be) then you could calculate and plot the outer envelope of the matching range for any given frequency. The math isn't too terrible.

Not really as it could mean magnitude |R+j| or just R.

It shows that the author of the specs doesn't understand impedance which is two dimensional (real and imaginary part), and he is appealing to those hams (probably the majority) who think that the magnitude of Z (which is a scalar quantity like they have used) will win the sale.

If we read it litterally, they have given they have writen impedances with a real part and zero for the imaginary part. The equivalent VSWR (50) is 5:1 (funny that). It is not a very wide range tuner for those purely resistive loads.

That said, the information doesn't help much in selecting the tuner because you will almost always use it with a load where X is not only not zero, but quite likely much greater than the R component.

It is BS technospeak for a dumbed down pseudo tecnical buyer.

Owen

-

Thanks to all the responders. I assumed that the spec was to indicate a general ability to match 5:1, but as Owen said, a dumbed down spec.

Anyway, it is an older Yaesu tuner with a lot of flexibility. I've used it for years, but am currently considering some different antennas.

You mean when earth is generally heading "towards" the galactic center vs when earth is heading "away" from the galactic center?

People doing deep space navigation deal with this all the time, since navigation is done by measuring the frequency of the received signal from the spacecraft. There's nothing special about it. spacecraft on some heliocentric trajectory, Earth on a different heliocentric trajectory. Measure frequency shift, they use to determine spacecraft trajectory by applying (mostly) Newtonian physics (you do have to use relativistic corrections to get the last gnat's eyelash of precision).

Since you only get to measure in one direction, you have to make assumptions about what's going on in the other directions, (e.g. cross range), which can lead to disasters (Mars Climate Orbiter, most recently).

You can do various forms of VLBI and DeltaDOR to get some cross range information, but nothing as good as what you're getting for range (where velocity and range are measured to mm/s and cm sorts of accuracy)

Yes. But on the Earth orbit are places when this speed is 0.5 km/s (only
rotation) or 30 km/s. (orbital speed).
>
> People doing deep space navigation deal with this all the time, since

Like the Earth and Mars.

>Measure frequency shift, they use to determine spacecraft trajectory by

They confirm the diurnal changings in the frequency. But what with the
annual?
>

Naw are the spacecraft at distances almost like stars. They are not on
heliocentric trajectory.

So I repeat my question:
" I have found the link:
http://chaos.swarthmore.edu/courses/Physics130_2008/Pioneer_Anomaly.pdf

""It is also possible to infer the position in the sky of a
spacecraft from the Doppler data. This is accomplished by

examining the diurnal variation imparted to the Doppler shift

by the Earth's rotation. As the ground station rotates underneath

a spacecraft, the Doppler shift is modulated by a sinusoid."

Here they confirm the diurnal variation in the frequency.

Probably in this paper is also the answer for my question: "And what about

the 365 days period (annual variation in the frequency)?
Unfortunately I am not an expert in radio. Do you know the answer?

S*

Yes, and, for instance, they measure the Doppler shift in the signals radiated from spacecraft/rovers in orbit/on the surface of Mars as they arrive at earth.

As expected, the Doppler has several components: one from the rotation of Earth, one from the rotation of Mars (for a surface asset), and one from the relative motion of Mars and Earth (which is periodic with about a 2 year, 2 month period)

No surprises, nothing unusual. In fact, *tiny* variations in the Doppler are used to compute the orbit around planets, and from that, infer the internal structure of the planet. Juno is going to Jupiter right now to do this, and the Doppler will be measured with a precision of about 1 part in 1E15 (measured over 100-1000 seconds).

All changes in frequency, of course. Load up the SPICE kernels, run the numerical integration, and the expected frequency pops out.

All spacecraft that humans have launched are on some form of either planetary centric or heliocentric trajectory or a combination of both. In any case, they are computable (viz. Gauss) and measureable.

That's somewhat of an over simplification, but it's essentially true.

The paper describes the technique used to measure the frequency.. A signal is generated on the ground at 2.11 GHz, locked to a hydrogen maser. that signal is radiated to the spacecraft, which uses a phase locked loop to track it. The spacecraft sends back a signal with a frequency/phase ratio of exactly 240/221 (i.e. about 2.29 GHz) which is received on earth and compared with the same hydrogen maser.

>

> Unfortunately I am not an expert in radio. Do you know the answer?

Do you want to know the magnitude of the shift? Earth's orbital velocity is about 30km/s, so the fractional frequency change is 1 part in 1E4 (100ppm). That's huge compared to, for example, the change due to the oscillator frequency aging. Considering that for deep space navigation, frequencies are regularly measured these days to parts in 1E12, this is something they deal with on a day to day basis at the Deep Space Network.

if you want more details, take a look at equations (3) through (6) on page 11-12 of the 50 page paper you cited, which gives a nice detailed explanation of all the factors they are taking into account. And, they nicely note how you can use the models to implement theories of gravity other than general relativity.

equation 4 describes the light time (which ties to doppler measurement) and includes the relativistic corrections as well.

they take into account things you haven't mentioned such as changes in the earth orientation (precession, for instance), changes in earth rotation rate.

"In summary, this dynamical model accounts for a number
of post-Newtonian perturbations in the motions of the planets,
the Moon, and spacecraft. Light propagation is correct to
order c^-2. The equations of motion of extended celestial
bodies are valid to order c^-4. Indeed, this dynamical model

has been good enough to perform tests of general relativity
@28,51,52#."

I'd comment that if you read and understand the entire paper, you're well on your way to really knowing how we do deep space navigation and the myriad things that have an effect and must be taken into account. They also have a VERY complete discussion of numerical computation effects.

They also do mention an annual sinusoid (not accounted for by simple orbital motion) of 1.6E-8 cm/s^2... (about 0.012 Hz at 2.29GHz) (page 37) which they attribute to small problems in their modeling of the solar system that are normally masked by other noise sources, but because Pioneer makes such a good detector, you can find it.

I'll note that the anomaly identified in the paper has since been analyzed extensively, and as I recall, once you take into account the thermal radiation pressure with sufficient accuracy, you can account for it.

(there has been a substantial improvement in computational and modeling capability in the last 10 years, since that paper was published) After all, the paper says "Further experiment and analysis is obviously needed to resolve this problem."

They wrote (page 37): "
Fig. 17, which shows the aP residuals from a value for aP of

(7.7760.16)31028 cm/s2. The data was processed using

ODP-SIGMA with a batch-sequential filter and smoothing algorithm.

The solution for aP was obtained using 1-day batch

sizes. Also shown are the maneuver times. At early times the

annual term is largest. During Interval II, the interval of the

large spin-rate change anomaly, coherent oscillation is lost.

During Interval III the oscillation is smaller and begins to die"

I "read the entire paper" but I do not and understand if the above "During Interval III the oscillation is smaller and begins to die" means that the annual variation in frequency die when the spacecraft was very far.

I was ony trying to pick up if the annual variation in frequency take place or not.

The reason is simply. The diurnal variation are in agreement with the Michelson-Gale experiment. The annuall should be null like the famous MM.

Sure..
Some are in that paper you cited.

I imagine so, although I don't know where one get the data off hand.
But they archive and publish pretty much everything that comes down
along with all the radiometric data (doppler, phase, signal strength) in
various and sundry mission data repositories. getting it in a
convenient translated form might take some work.

Look for what's called Level 0 telemetry data from your missions of choice.

The "anomaly" variation or the "variation due to earth in its orbit"? I
suppose the answer to both is "yes"

>
> The reason is simply. The diurnal variation are in agreement with the

If you need raw data, you'll need to look for it. I'd suggest starting
with the Planetary Data System http://pds.jpl.nasa.gov/

Maybe the stuff at NAIF (Navigation and Ancillary Information Facility)
might help.

There's a lot of stuff out there, but, for instance, I ran across the
raw Radio Occultation Original Data Records from Ulysses. It has a
description including: "These data are
obtained from the Radio Science Support group at JPL. They consist
of time-ordered, high-time resolution Doppler data from special
radio science receivers (so-called 'open loop' data)."

There's a lot more description online and that's probably not a data set
you're looking for, but the data is out there, if you're willing to go
digging through it.   I doubt anyone is going to give you exactly what

you're looking for, though. You'll have to do some conversion, and you'll need to know a fair amount about how all the tracking systems work, but that's all published. You might start with the DSN 810-005 online document (google for it).. That will tell you how they record the data and the format.

A more recent data set is from MRO
"This data set contains archival raw, partially processed, and ancillary/supporting radio science data acquired during the Mars Reconnaissance Orbiter (MRO) mission. The radio observations were carried out using the MRO spacecraft and Earth-based receiving stations of the NASA Deep Space Network (DSN). The data set was designed primarily to support generation of high-resolution gravity field models for Mars and secondarily for estimating density and structure of the Mars atmosphere. Of most interest are likely to be the Orbit Data Files and Radio Science Receiver files in the ODF and RSR directories, respectively, which provided the raw input to gravity and atmospheric investigations, as well as the ionospheric and tropospheric media calibration files in the ION and TRO directories, respectively."

http://starbrite.jpl.nasa.gov/pds/viewProfile.jsp?dsid=MRO-M-RSS-1-MAGR-V1.0

Among the stuff in that particular data set is:
"	The ODF is a compressed version of the TNF. It contains the most important information (range, Doppler and frequency ramps) needed by spacecraft investigators, and investigators interested in determining gravity fields. Each ODF is accompanied by a full PDS label which describes both the content and format of the associated file. ODF data fields include:

Narrowband spacecraft VLBI, Doppler mode (cycles)
Narrowband spacecraft VLBI, phase mode (cycles)
Narrowband quasar VLBI, Doppler mode (cycles)
Narrowband quasar VLBI, phase mode (cycles)
Wideband spacecraft VLBI (nanoseconds)
Wideband quasar VLBI (nanoseconds)
One-way Doppler (Hertz)
Two-way Doppler (Hertz)
Three-way Doppler (Hertz)
One-way total count phase (cycles)
Two-way total count phase (cycles)
Three-way total count phase (cycles)
PRA planetary operational discrete spectrum range (range units)
SRA planetary operational discrete spectrum range (range units)
RE(GSTDN) range (nanoseconds)
Azimuth angle (degrees)
Elevation angle (degrees)
Hour angle (degrees)
Declination angle (degrees)
"

So there you have all the VLBI and doppler info you're looking for.

The actual data files are at
http://pds-geosciences.wustl.edu/mro/mro-m-rss-1-magr-v1/mrors_0xxx/
(There's a link at the PDS catalog entry)

There's documentation on the format of the ODF files, and I see that
they actually give you Doppler and range observables, rather than raw
counts, which is nice.

Knock yourself out...

They confirm the diurnal oscilations.
They do not mention the annual.
So I assume that the annual are null.

The answer I am loking for is not important for me.
I have come accros an information that astronomers add the orbital speed of
the Earth to the radial speed of stars measured with the spectrographic
method.
The radio method are the same like the spectrography. But it contradicts
MMX. So I am trying to clear it.

Uh.. no.. you have a theory or question, but aren't willing or able to
do the work (or find someone else to do the work) to actual resolve the
issue.

Tons of data
Tons of analysis out there

You've got a question, you need to answer it.
(or, just wait until someone else happens to answer it for you...)

Yes. I am not able.
But here is nothing to do. Some people know the Doppler effects components:
"the Doppler has several components: one from the rotation of Earth, one
from the rotation of Mars (for a surface asset), and one from the relative
motion of Mars and Earth"

I am looking for information about relative motion of "Mars and Earth" and
"Earth and Pioneer".

"wait until someone else happens to answer it for you..." is the only
possibility.

Sooner or later it will be in textbooks.

Now in textbooks no Michelson-Gale experiment.

You sound like the man in the street who claims that "the theory of
relativity is wrong".
But in your case you don't even refer to something as complex as
relativity but as simple as doppler shift.

There are existing formulas that allow you to calculate the doppler
shift when knowing the speed of the items, and the measured results
confirm what you calculate. So why do you keep questioning it?

When you have found an old article that does not agree with what is
measured today, why do you keep insisting that the old article is
correct and suggeest the theory is wrong, when you don't have the
capability to back that up with proofs that you present yourself?
Isn't it better to assume that the measurements in the old article were
not correct?

It is true for the Earth rotating.
For the orbital movement of the Earth the result is null according to "the
theory of relativity".
>
> When you have found an old article that does not agree with what is
> measured today, why do you keep insisting that the old article is
> correct and suggeest the theory is wrong, when you don't have the

> Isn't it better to assume that the measurements in the old article were
> not correct?

In physics textbooks the old article is correct.

Once more: "Today's spectrograph astronomers assume that the effect is not
null.

It seems to me that today's astronomers are wrong because in physics are
still null result.
So I am looking for the result from communication with the spacecraft."

I should wrote: "Some astronomers ASSUME..."

To be precise now are available the spectrograph with built-in the
corrections for the all movements of the Earth and Sun.
But user can switch off same of them.
It seems to me that at measurements of the radial speeds of stars the
correction for the orbital speed of the Earth should be switched-off.

What is your opinion?

Not the case.

In 1905 Einstein wrote: "Examples of a similar kind, as well as the unsuccessful attempts to substantiate the motion of the earth relative to the "light-medium", ..."

It is still valid. One of the attempts was famous MM.

In 1925 Michelson-Gale "substantiate the motion of the earth ROTATION relative to the "light-medium". It is in agreement with SR. (Like Sagnac).

But things are changing. May be that the attempts with using the radio waves supply the opposite results. But I do not come across on such.
So I am asking the radio experts.
S*

Jim Lux <james.p.lux@jpl.nasa.gov> wrote in news:j846r5$7h3$1@news.jpl.nasa.gov:

> There's a goodly bit of empiricism in trap design.

And a goodly bit of misinformation in some of the traditional ham sources.

I have had an interest in the so called coax traps, and just in the last week or so, make some headway with some good measurments of the underlying inductor formed by the coil of coax shield. There were some surprises. For those interested, see http://www.vk1od.net/antenna/coaxtrap/index.htm .

Short of performing Medhurst style measurements on a range of inductors, there is no way to be sure that the effects observe apply generally, or what a more general model might be.

Owen

>   http://homepage.ntlworld.com/wadei/aim4170.htm

Say, after following the link, above, I just took a look at that AIM4170 web site and it looks like it's more trouble to get it up and running than most things. A lot of the steps are left to the imagination ... or they assume a whole lot about what potential buyers already know.

Anybody want to toss me a bone in the form of reassurance that it's easier than it looks? Cables, adapters,serial-to-USB (a known PITA), etc.

Thanks in advance,
"Sal"

Sal

I assume you are talking about the AIM Forum, here:

http://aim4150.proboards.com/index.cgi?board=analyzer

Yes, there are many questions about AIM4170 operation there, but look closely at the dates of the messages. Most of them are now very old. The software has settled down very nicely now, and the instrument is indeed very easy to set up and use.

To find out all the information you need, download the latest version of the software (currently in AIM_846.zip), from here:

http://www.w5big.com/prog_update.htm

The download contains the AIM software (which you can run in demo mode without the AIM hardware), plus the manual.

There is a fair amount of literature on L and C (and loss) for shielded
inductors, which is what a lot of traps look like.. the ones which use
the C to the surrounding tube, anyway, like in the 4,5,6-BTV. Some
papers have generic cookbook-ey design equations which might be useful
(although I don't have any citations off the top of my head).

For a bare coil of the appropriate L/D ratio, Medhurst will get you in the right starting place.

The problem would be things like manufacturing variability, if you're copying (or writing instructions) one-off design. Stuff like 'how thick is the enamel/polyurethane/PVC insulation'.

Sort of like the measurements of Z and loss for zipcord. The dielectric properties aren't controlled in manufacturing, so what you measure on brand X, 16 Feb 2001 may have little or no relation to what you measure on brand X, 20 Oct 2010 vintage.

Sal, I bought an AimUHF, and it worked fine out of the box.

I suspect that the problem that most hams encounter with analysers and VNAs is that the knowledge of basic complex numbers, AC circuit theory, transmission lines, and antenna systems does not 'come in the box'.

If acquiring such a thing is the stimulus for expanding knowledge on those topics using the box as a learning aid, that is great. But to many, they are safer to just treat it as a VSWR measuring device.

I am staggered by the popular advice offered to newbies who ask 'why is my VSWR high' on eHam and QRZ to borrow an analyser. The advice appears to offered mainly by people who don't understand the instruments, and possibly have never used them effectively.

A classic example is the advice to connect the instrument at the shack end and tune for resonance, for as everyone knows, "an antenna just ain't gonna work any good unless it is resonate (sic)".

The getting of knowledge just isn't a priority in a world of instant gratification.

Owen

All noted.

Many readers will recall my interest over more than a decade in predicting the effective RF resistance of the outside surface of a braided coax shield, especially when it forms a solenoid... as in the coax traps.

The last round of measurements by VK2KRB were most interesting, because they strongly suggested that Q was not proportional to root of f as Medhurst and predecessors observed for round copper wire (and of course, R was higher than for an equivalent sized round copper conductor).

Jim, interesting that you mention ZIP cord. I have seen a number of articles recently discussing the TL characteristics of ZIP cord, and again many readers will recall Jack Smith's measurements published here about 10 years ago.

I recently put a new TL calculator up, it uses input parameters of Ro, vf, k1, k2 to solve problems similarly to the older TLLC. It is at http://www.vk1od.net/calc/tl/atllc.htm . I wrote an article with some examples of using it at http://www.vk1od.net/calc/tl/atllcEx.htm . Example 2 plots Jack's data on ZIP attenuation from back then. A stunning set of measurements, and statistically tighter than I have seen from any one else. Nevertheless, I see a wavelike shape to the error between actual and the model, a growing sinusoid that prompts the question of why, was it some common mode effect and radiation.

Owen

Dear Group: An echo: the AIM4170 is the greatest thing since sliced bread (or NEC) for serious antenna people. I use one with an inexpensive- very small, slow, lap-top to great effect.

The device is also ideal for measuring real components. The ability, if you buy a small set of high quality resistors, to calibrate out the effects of fixtures is a delight to use. I have a GR bridge. It has long been the standard. But my goodness is its use a lot of work.

Note that the device can tell the sign of the phase and I have found that it works well in the presence of strong signals. Indeed, one feature is that the device may be asked to scan a band of frequencies and display the stronger signals found. It is also very easy to calibrate the internal frequency reference to WWV. All of this with only one moving part - the on/off switch.

Sal, I bought an AimUHF, and it worked fine out of the box.

I suspect that the problem that most hams encounter with analysers and
VNAs is that the knowledge of basic complex numbers, AC circuit theory,
transmission lines, and antenna systems does not 'come in the box'.

If acquiring such a thing is the stimulus for expanding knowledge on
those topics using the box as a learning aid, that is great. But to
many, they are safer to just treat it as a VSWR measuring device.

I am staggered by the popular advice offered to newbies who ask 'why is
my VSWR high' on eHam and QRZ to borrow an analyser. The advice appears
to offered mainly by people who don't understand the instruments, and
possibly have never used them effectively.

A classic example is the advice to connect the instrument at the shack
end and tune for resonance, for as everyone knows, "an antenna just
ain't gonna work any good unless it is resonate (sic)".

The getting of knowledge just isn't a priority in a world of instant
gratification.

Thanks, Ian,

I did look at the forum briefly, but my reference was to this page
 http://www.arraysolutions.com/Products/AIM4170.htm and one
or two links out. There were fleeting references to several operating
systems versions, as well as talk about USB-to-COM-port adaptation,
which scares me. (Never tried it; numerous horror stories are extant.)

I gleaned no real knowledge as to what I needed to buy to make it
work with both my WinXP box in the shack or my WinVista laptop.

I'll grab the software, load it and take it for a drive. It's not that I'm some Chicken-S kid who needs a lot of hand holding. (I have seven computers, running everything from DOS 5.0 to Vista, with Mac OS 10.5 and Ubuntu Linux thrown in.) I just don't want to spend $700+ for a leap into the abyss.

Thanks for the advice.

Thanks, Owen,

I understand the world of complex numbers and vector impedance
well enough. My concern is whether I can make the thing work with
what appeared to me to be a dearth of hookup instructions.

How did you know what cable(s) to order? Are you operating with
a software COM port or do/does your computer(s) come with a
hardware COM port?

Anecdote:
Right after Field Day, for which I am the club Chairman, I followed
a fellow club member's suggestion to try to get a network logging
program running in preparation for next year. No dice. Hours
wasted.

I followed many conflicting or wrong instructions; the best I managed
was to get the two computers to each acknowledge the existence of
the other -- but no more. No sharing of information and darn little

help from the maker of the software, who assumes we are are all
networking engineers.

Moral:
So, with the bitter taste of failure still fresh, I'm not really ashamed
to act shy around this next (possible) installation.

As I told Ian, I'll try the software and see if it radiates warmth. It
needn't be hot ... just not ice cold. :-|

The AIMuhf connects to the computer by USB, just a mini USB IIRC, and I think they supplied a cable.

>

The software is a very important element.

In my experience, the software with these kinds of things is amateurish... but usable.

I also have a TecTec VNA, but I avoid using it if I have something else that will do the job, and the AIMuhf is usually better if a one port VNA is up to the task.

You will see plots from both of those in the article http://www.vk1od.net/antenna/7MDipole/7MDipole02.htm .

There are other ham grade VNAs, I haven't researched them deeply, some may be kits or homebrew that leave you challenged to find some of the parts.

Very interesting comments,,

I have had two or three visits to the sauna with high heat and nothing
exploding yet or breaking down of rocks yet.

Thanks for all the great comments. Have great day and 73s

Interesting..
So the loss is about 0.12 dB/meter at 10 MHz, compared to, say, RG-58 at
0.04 dB/meter. That's a huge difference, especially since the center
conductor on the RG-58 is probably smaller than the zip cord (what was
the wire size? I think you cited 1.22 mm diameter? AWG 16? or AWG 18?)

The sizes came from Jack. 1.2mm is about #16.5.

The loss model suggests that dielectric loss is significant, even at
10MHz. Yes, I think you are correct that the inner conductor of RG58 is
fractionally smaller. IIRC, about 80% of copper loss in coax is in the
inner conductor, so the ZIP cord is at the disadvantage of having a
smaller 'other conductor' compared to the shield of the coax. There may
be some further degradation due to proximity effect. (Of course, ZO
favours the ZIP line.)

It seems that the copper loss is close to four times what might be
expected of round copper conductor. I don't know whether the conductors
were tinned, and what the effect of stranding was.

Another possible source of loss is radiation as I mentioned in the
earlier posting.

I note that Belden ceased supply of its 75 ohm twin lines, though I think they used PE dielectric. Their #13 (8210) seems to have higher conductor loss than accounted for by round copper conductors with normal skin effect.

I can't help but be suspicous that proximity effect is a significant part of the reconciliation gap.

Owen

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting

Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/
d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

> drain the last of the piss coming from the urinal.
>
> The whipping stopped and the boys let down. Then I could hear the
> master of the house approach my box. The lid above me was lifted and
> light flooded in. I could see that it was a toilet seat above my face.
> I looked to the tube and back up. "Oh, No!" I cried.
>
> "Shut up, scum!" He spat onto my face. "You know better than to
> speak." He looked back at the crowd. Faces peered over the lip to see
> if I was really in here. "gentlemen, you will indulge me to go first.
> Please feel free to use my other slaves as you please. Then avail
> yourself of this unique toy as it becomes available."
>
> He looked down at me. "Hungry, Boy?" he grinned, knowing I was
> starving. "Well, look out! It's dinner time for the scum hole!"
>
> With that he unbuckled his chaps and pants. I struggled looking for a

> way to avoid this. I could drink piss. But... this?
>
> His ass lowered slowly to the seat. His cheeks spread apart by the rim. His cock rested in a scoop at the front. Over my eyes. It seemed to lead to a bottle. The box became a little darker again as his body covered the hole. His stinking hole was a few inches away from my lips. He moved forward a little and I felt my head being jack up to his butthole. "Put you lips up to my shitter and kiss it in gratitude for the meal your going to get from it." Not wanting to disappoint my master, I did as I was told. His hole was a little puckered and was moist a little. It stank like shit already. Like he hadn't wiped last time. I kissed his hole and pulled my lips back. "No boy, give that hole some loving. Slip it some tongue."
>
> I put my lips to his shitty hole again and stuck out my tongue. Which sank into his opening hole. It tasted bitter and rank. Like rimming someone who hadn't cleaned. Something master liked doing a lot lately. Now I understood why. "Good. Now lick my hole clean. Boy. I want your dinner spot to be tidy."
>
> I tongued his hole. It tasted awful. I gagged a little and he pushed down some more. His hole opened and there was more to clean. I pulled back to take a breath and he farted. It smelled like ripe shit. Powerful. I put my lips to his hole again and stuck my tongue into his shitter. My tongue sank into hot, wet, soft, shit. I quickly pulled back and he moaned and my mouth was filled, cheeks full, with his steaming shit load. He laughed and looked between his legs to my eyes. "Chew on my hot shit, fucker. You are just my fucking toilet. Swallow my turd pile, scum."
>
> My eyes watered with tears as I chewed and tried to swallow his shit. He looked mean at me. Like I had better not throw it up. Finally. I managed to gag his load down. Shit hung, wet, off his hole. I licked it up and his hole opened again. This time it was firmer and it came out in a steady loop of turd. I swallow quickly trying get it out of my mouth at least. I gagged a few times and my mouth filled up with my cheeks puffed out with his shit. Finally, the shit stopped. I chewed while he lifted up to watch. When I was done he made me lick his ass clean again. He stood up to cheers from the other men. "Remember, to flush the toilet, when you are through, guys." With that he released the piss in the bottle his cock hung into onto my face, I gulped up as much as I could to wash the taste of the shit that coated my hole inside of my mouth.
>
> I discovered that there where twelve men at this party. because each one of them came to use the human toilet over the evening. I drank many many loads of piss out of the urinal, glad for the chance to rinse my mouth of their shit. I ate hard shit from a lean muscular butt. I endured diarrhea runny shit from a large man. Some had bits of food in it like corn, and peas. One guy got off on having my tell him how great I loved his shit in my mouth. While juggling a larger chunk of his turd in my mouth.
>

```
> When the playing seemed done. Everyone got quiet. The whole top to the
> box was undone. I was unstrapped and lifted up my a few of the men. My
> stomach was bloated with all of their shit. My face was smeared and
> stained with their stinking mess. I was led over to a plastic playmat
> in the center of the room. Then the man who was my master's buddy
> announced that he did this to prove to his slaves that they should eat
> his shit as part of their service to him. They had agreed to begin
> that service on their new contracts, if he could show that other
> slaves eat shit in service of their masters.
>
> The two boys looked angry with me. The master unlocked them and
> unchained them and led them to the mat. "My slaves may now exact their
> revenge on our toilet, who has brought them into my toilet service."
>
> The two boys came to me and tackled my down. I was too weak to fight
> them anyway. They pinned me down and one sat on my chest. His knees
> around my head. He started to piss in the air landing it on my mouth.
> The other kicked my nuts, and my mouth opened to swallow his slave
> piss. The other one came around when the first stopped pissing. He sat
> facing his counterpart and placed his hole on my mouth. His shit slid
> out and he screamed at me to eat his fuckin shit load. The other
> chimed in with him is their derision of me. I swallowed the slaves
> shit dutifully. It tasted of dog kibble a little. Like the kibble I
> eat. I guess they are on the same diet. The first one finished and got
> his ass licked clean. Then he wanted to fuck me. He got behind and
> thrust in. The one on my chest moved off and dumped a load of shit on
> the playmat. A good size pile of soft, firm boy shit. He had me lick
> him clean too. Then he flipped me over with his friends dick still up
> my ass. Then he shoved my face into his pile of shit while the other
> continued fucking me. He forced me to lick the mat clean of his shit.
> Then he jerked off on my shit caked face and made me wipe it off and
> into my face. I was humiliated worse than anything I had ever
> imagined. But, as I swallowed the slaved cum and shit. I came too.
>
> I just know that master and I will have a different relationship when
> I am returned.

Suppose my square loop antenna oxidizes. Does that affect its
characteristics?

Thanks,
John  KD5YI

Yes. Its color changes :-)

Beyond that - as far as RF characteristics go - the answer is probably "Yes, but probably not enough that you would be able to detect the difference in practice."

What I believe would happen:

(1) As the surface oxidizes, its resistance rises. This will cause some amount of additional signal loss, as current flows through the resistive layer.

The actual amount of added loss will depend on the depth of the oxidized layer, its actual resistance per square compared to that of the underlying copper, and on the frequency (which influences the *skin depth" of the material).

Interestingly, the greatest amount of added loss does *not* occur when the oxide layer's resistance is at a maximum (near-infinite), since little or no current will flow through the oxide... it becomes "invisible", and the current will flow through the metallic copper under the oxide. The losses are highest when the oxide layer is (1) of moderate resistance, and (2) fairly thick, compared to the skin depth. At this point, most of the current will be flowing through the oxide, and excluded from the metallic copper by the skin effect.

I don't know the actual numbers involved here (i.e. point of greatest loss, for any given frequency). In practice I don't think you'll come anywhere near these conditions for a copper-wire antenna at UHF frequencies.

(2) Copper oxide is not electrically linear - it behaves somewhat like a semiconductor (you can actually make a diode out of it).

This nonlinearity may result in the generation of some second- and higher-order harmonics, and possibly some intermodulation products, if a significant amount of current is flowing through the oxide layer.

I doubt that this will be detectable.

(3) If you manage to get oxidation into your actual metal-to-metal contacts (and not just on the surface of the metal) the problem in (2) becomes a lot worse, since you can have *all* of your signal power flowing through what amounts to a diode. Harmonics and IM products can become much more of a problem.

In practice, I'd say that if you make sure that (3) is not a problem... that is, all of your actual metal-to-metal contacts are soldered or welded (or gooped with a conductive anti-oxidant paste prior to assembly) you'll be OK, electrically. Surface oxidation on the loop is unlikely to be a problem.

You could always scrub down the loop with Brasso, wash it carefully and dry it, and then spray it with an industrial-strength outdoor-rated UV-proof clearcoat. That would leave it shiny and bright for quite a long time.

My prior 'Net search revealed opinions from at least two camps, so I thought I'd ask here.

Re: Color, I'll check with my decorator :-)

Re: Item (3), connections will be soldered.

I will be using #14 gauge wire as used in house wiring. I could leave the insulation on the wire, but moisture has a habit of wicking into the tiniest exposed crevice, as you are aware, and I'd rather not have to perform heroic efforts to prevent oxidation. By removing the insulation, I can at least observe the severity of oxidation and guess at whether it correlates to any observed communication problems.

Thanks for the complete and thoughtful answer, Dave. You have persuaded me to proceed without worry.

73,
John KD5YI

Loops are good! I have a full wave 160 meter loop, horizontal, at 35ft. The copper begins to turn color within a month or so.

I see your address is Plano, TX. If you are down wind from any chemical companies or oil refineries or houses that use oil heat, or even natural gas users, the antenna and soldered connections will not just oxidize, but will have other chemical reactions to the sulfur and other acids in the air.

When I lived in Portland, Oregon, years ago, we and all the neighbors had oil heat. She sulfur from burning oil caused lots of corrosion on copper and soldered connections. Hope you have better results. As noted, clear plastic spray will help a lot on the soldered parts.

Paul, KD7HB

Plano is north of Dallas. The prevailing winds are from the south. That
says it all.

The antenna looks like a diamond and is only about 1 foot in its greatest dimension. It will be mounted no more than 6 feet above ground. If I give it some thought, I can probably design the whole project such that the antenna can be replaced without too much trouble.

Thanks for your input, Paul.

73,
John KD5YI

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.2 2009/11/25 14:41:01
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

 rec.radio.amateur.antenna |
 rec.radio.amateur.boatanchors |
 rec.radio.amateur.dx |
 rec.radio.amateur.equipment |
 rec.radio.amateur.homebrew |
 rec.radio.amateur.moderated |
 rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

"The first observations of cosmic radio emission were made by the American engineer Karl G. Jansky in 1932, while studying thunderstorm radio disturbances at a frequency of 20.5 MHz (14.6 m). He discovered radio emission of unknown origin, which varied within a 24-hour period. Later he identified the source of this radiation to be in the direction of the centre of our Galaxy. From: http://encyclozine.com/science/astronomy/radio

I understand that the frequency "varied within a 24-hour period". It is the "diurnal effect".
And what about the 365 days period (annual effect)?

It is not the frequency that changed, but the intensity. And not a 24
hour period, but 23 hours, 56 minutes, thus proving that the noise was
not generated or varied by the earth's rotation.

Yes. "His" transmitter "produced" many frequencies. But Karl G. Jansky was
the pioneer in Radio Astronomy.

Now are the spacecrafts. They use the two frequencies.
I have found the link:
http://chaos.swarthmore.edu/courses/Physics130_2008/Pioneer_Anomaly.pdf

""It is also possible to infer the position in the sky of a
spacecraft from the Doppler data. This is accomplished by

examining the diurnal variation imparted to the Doppler shift

by the Earth's rotation. As the ground station rotates underneath

a spacecraft, the Doppler shift is modulated by a sinusoid."

Probably in this paper is also the answer for my question: "And what about
the 365 days period (annual effect)?

Unfortunately I am not an expert in radio. Do you know the answer?

I have about 94 inches of RG-142B/U. I am using a Fluke 6061A signal generator, an HP 8405A Vector Voltmeter, and a Narda dual directional coupler. I have tried to measure the line characteristics at 434 MHz but I am not satisfied that the results are accurate. It is very difficult to get good short and open circuits at this frequency and I also wonder if the 8405A accuracy suffers since a short is well away from the nominal system impedance of 50 ohms.

What if I simply calibrate the 8405 with a short on the end of the line
(the measurement plane) then attach my antenna and accept the readings?
Will they be very far from the real value?

Thanks,
John KD5YI

The easiest way to get the characteristics of the line is to look up the manufacturers data. Somehow I don't think that this is really what you are looking for !

Irrespective of line length if its terminated in its characteristic impedance then you will only measure unity vswr. Open or short circuit terminations are easy enough to obtain. Having a known input quantity and measuring the return value will give you the line loss for that particular line length.

I suspect that its actually the antenna characteristics that you are seeking to measure ! In which case I would use a line, accurately cut, to be number of half waves long, then the impedance presented at the far end would be repeated at the near end. Of course you would need to have an accurately cut quarter wave length in order to determine whether the load was inductive or capacitive in nature.

I'm sure that if I'm mistaken some of the more knowledgeable will correct my errors.

He's not. He's just obsessed.

He loves to ask questio0ns, get answers, and then tell all of us that any science newer than 100 or 150 years old is incorrect. Even when the scientist in question changed his original theory due to newer and better evidence.

It will happen. Just wait a bit.

Dear John S: Conventional wisdom and common sense suggests that measuring Zin (with an open and then a short at the far end) at a frequency where the transmission line looks like an odd multiple of 1/8 WL tends to provide the best quality of measurements to be used to characterize a piece of coax. Such measurements tend to result in two numbers that are similar. Extrapolation to 434 MHz should provide reasonable estimates.

The UHF version of the AIM4170 and its software will provide the values and do the indicated calculations. Of course, one needs to select the reasonable value (from the infinite inherently provided) for rad/m - but that is rarely an issue. Your equipment too should be able to provide the two values of Zin and a good HP calculator will do the rest.

Measurements near, say, frequencies where the coax looks like multiples of 1/4 WL produce numbers that are not favorable for calculation. Baron provides other ways to think of the task.

No doubt you know this, but others might not. 73, Mac N8TT

Once more:
""In 1818 Arago found that the refraction of a prism for star light was the same for light incident in the direction of the earth's orbital velocity v as for that coming in the opposite direction. This unexpected null result was explained that same year by Fresnel's ether-dray theory, which assumed partial ether entrainment in transparent media by an amount depending upon the first power of v." From: http://www.3rd1000.com/chronoatoms.htm

Today's spectrograph astronomers assume that the effect is not null.

It seems to me that today's astronomers are wrong because in physics are still null result.
So I am looking for the result from communication with the spacecraft.

> I have about 94 inches of RG-142B/U. I am using a Fluke 6061A signal generator, an HP 8405A Vector Voltmeter, and a Narda dual directional coupler. I have tried to measure the line characteristics at 434 MHz but I am not satisfied that the results are accurate. It is very difficult to get good short and open circuits at this frequency and I also wonder if the 8405A accuracy suffers since a short is well away from the nominal system impedance of 50 ohms.
>
> What if I simply calibrate the 8405 with a short on the end of the line (the measurement plane) then attach my antenna and accept the readings? Will they be very far from the real value?

I am a little confused about your objective. The subject line seems inconsistent with your discussion.

If you are trying to measure Z at the reference plane in the simplest manner, then what you propose in your last par should give you the magnitude and phase of the reflection relative to a s/c (where Gamma=-1).

This simple paired measurement of the reflected wave from a s/c and unknown load depends on the forward wave being constant. That is true if the Thevenin source impedance of the source at the coupler is equal to the nominal characteristic impedance of the coupler and the coupler terminations, cables etc that you use. That would usually be met by a standard signal generator etc, but some SSGs depart from ideal on their

highest output settings (check the specs). Measuring the forward wave
under significantly different loads will provide an indication as to
whether you can assume that it remains constant with different loads.

I give an explanation of why Vf is constant when Zs=Zo at
http://vk1od.net/transmissionline/VSWR/Zs50.htm .

You will recall that there is an ongoing argument that a ham transmitter
is well represented as a Thevenin source with Zs=50+j0 ohms, as some
accident of design. The article describes a simple test using an
accurate directional wattmeter to demonstrate that under different drive
level and different frequencies, that Vf is often not necessarily
independent of load impedance and that calculations that depend on
constant Vf (such a Mismatch Loss) are in error.

I should have explained that this simple approach assumes the coupler etc
to be ideal, the measurement instrument accurate etc.

We make those assumptions in using something like a Bird 43 to find VSWR,
you could use your test setup with comparable accuracy to find more than
just the magnitude of Gamma (and hence VSWR), but also its phase and
therefore complex Z.

I think I am the confused one. Do I even need to know the transmission
line characteristics if I am going to short the load end and set the
vector voltmeter for a phase reference of 180 degrees?

I am following the HP app note AN-77 and they do not mention a
transmission line. They say to short the load end of the coupler. I need
to get my antenna away from the test setup, so I add the transmission line.

Has this made any sense?

John

The problem is that these measurements are designed to be made
as close to the instrument as possible. Adding a piece of transmission
line adds loss and phase shift to the measurement.

So unless you know how to work backwards from the measure you get to
what you're really measuring at the far end, you won't really have a
valid answer.

John S <sophi.2@invalid.org> wrote in news:j9c2h9$c69$1@dont-email.me:

...

If you are not concerned with trying to calibrate out the directivity of the coupler (and if that is greater than the expected / tolerable Return Loss, you don't need to do so), and you have convinced yourself that Vf is independent of load impedance (as it will be if Zs=50+j0 and you use short low loss line, or a large attenuator at the coupler to control Zs), then the simple approach is to do the following.

> I think I am the confused one. Do I even need to know the transmission line characteristics if I am going to short the load end and set the vector voltmeter for a phase reference of 180 degrees?
>
> I am following the HP app note AN-77 and they do not mention a transmission line. They say to short the load end of the coupler. I need to get my antenna away from the test setup, so I add the transmission line.

And you understand that the Gamma found is at the reference plane (the plane of the calibrating s/c), and you can adjust it, or the calculated impedance to another point on a known feedline using the well known Telegrapher's Equation (http://www.vk1od.net/calc/tl/tllc.php solves this problem for a range of popular lines), albeit subject to error due to uncertainty about the known line.

(I did consider at one stage extending TLLC to allow specification of mismatch in terms of Gamma, rectangular and polar, but no one ever asked for it and I thought it not in demand. The complication is that finding Z from Gamma needs to use the nominal Zo of the test equipment, not the actual Zo of the lossy transmission line. I usually use a spreadsheet to perform the calcs, Excel can handle complex numbers using the COMPLEX and IM* functions either in the Analysis Tookpak in earlier versions, or built in to the later versions.)

An important thing to keep in mind is that while the measurements you make are of the TL in differential mode, it may be carrying significiant common mode components which will affect the differential currents. In making your measurements, if you change the common mode current path from the normal system configuration, you are measuring a different system and the results might not apply. There seems an unwarranted assumption in most discussion of such measurement projects that there is inisignificant common mode current.

> Has this made any sense?

Perhaps it is my turn to ask.

Bill, don't know if you got an answer or not, but just saw your note, and
though I would have sworn it would combine gz filed I just tried it and it

errored on combining two adjacent dem.gz files but after uncompressing
combined them fine.

I use gunzip for uncompressing.

Also, mine identifies as version 10.0 build in 2006. Version 7 may be too
old, I think they kept developing after the author retired. I may be
confusing this with another free package, but I'm pretty sure that's it. In
fact I need to upgrade.

Just checked my version 12 here in the office and it will combine zipped DEMs.

Version 10 at home would not.

File>Data Manipulation>Merge>Dems>Dems--Pick Multiple

And select the two you want.

Afetr the merge is over you can give the merged file a name.

Their download page:
http://www.usna.edu/Users/oceano/pguth/website/microdem/microdemdown.htm

The cordless phone interference may be due to the power supply/charger. (I have a little wall wart that I use for my 220 HT during weekly local nets. It's so nasty that I need to unplug it when we shift to HF. Someday I will replace it. Someday I will do lots of things.)

Yes, quite likely as the wall wart is located about 1/4 wave on 20 m  from
the antenna, and  there are various possible paths.  With the weather
moderating, I'll be doing antenna projects soon.  The goal is 40-10 meters.
I have a separate 6 m whip on the patio cover also, but it doesn't seem to
operate as well as an attic dipole.  I'll verify that when 6 opens up a bit.

No, what you hear is mainly due to the orbital speed of the
satellite around the earth.  The satellite has a speed relative
to the observer, and the resulting doppler shift makes the apparent
frequency of the satellite change.

When using a linear transponder, the situation becomes more complex
because both the speed relative to the transmitter and the speed relative
to the receiver have to be taken into account.

I have found the two old measurements:
"In 1818 Arago found that the refraction of a prism for star light was the
same for light incident in the direction of the earth's orbital velocity v
as for that coming in the opposite direction. This unexpected null result
was explained that same year by Fresnel's ether-dray theory, which assumed
partial ether entrainment in transparent media by an amount depending upon
the first power of v." From: http://www.3rd1000.com/chronoatoms.htm

And:

2. Vogel, H. C., "On the spectrographic method of determining the velocity
of
 stars in the line of sight", Monthly Notices of the Royal Astronomical
 Society, Vol. 52, p.87, 1891 >
 "The first result of any importance which the spectrographic method
 furnished was the proof of the influence of the Earth's motion on the
 displacement, which the earlier direct observations had failed to show
 with certainity. [...]" From:
http://adsabs.harvard.edu/abs/1891MNRAS..52...87V

Who was right: Arago or Vogel?
The spectroscopy and the spectrography are not accurate.
The radio waves are.

The Doppler effect comes into play anytime two objects are moving relative to each other.

Ham satellites often go up on one sideband and retransmit on the opposit sideband to help counter this effect.

Now we know that the frequency from the stars reacts on the rotational speed
of the Earth (in agreemment with the Michelson-Gale experiment).

By the analogy the frequency should not react on the orbital speed (MM
experiment).

But I could not find the answer.

HI,

I picked up two coils that could be a trap for the CWA-840 COMET
antenna. (They have two stickers "CL-840").
The manual of the CWA-840 says : 40/80m dipole.

I found amazing that there isn't any capacitor in // of these coils...
These coils measure 76uH.
Could someone tell me how they works ?
In the manual of the CWA-840, each leg of the 7MHz section, is
11.1meters in lenght , wich, it seems to me, that it is rather longer
that 1/4 wave. (10.1m).
Why ?

Thanks a lot for your answers

CWA-840:

```
-----[   ]-------------ooo--//--
2.3m coil   11.1m     balun
```

Each waves has the frequency. The light frequency measured on the Earth
has the diurinal changes (in agreement with the Michelson-Gale experiment).
But what with the annual changes?

All coils are self-resonant at some frequency.  Wind it right and off you
go!

Good point, Sal. I hope the OP has a GDO to tell him the self-resonant
frequency. If not, there are other ways.

John, KD5YI

That is a rather simplistic characterisation of the trap. If you were to measure its impedance over a wide range of frequency, the data would give a better idea of the extent of any parallel capacitance (and there has to be some, even if only stray capacitance. Somethimes the capacitance is between some metal tubes that make the end supports for the trap.

Note that measuring the impedance of traps is very challenging.

> Could someone tell me how they works ?

The trap introduces some reactance and resistance that is intended with appropriate conductor lengths, to give a modestly low VSWR at the frequencies of interest.

The traditional explanation is that they are resonant at one of the frequencies of operation, and act like a switch, cutting off current to the outboard legs. Of course, current would flow in the outboard legs eve if you used a physical switch.

That explanation is appealing, but limits your options. There are advantages is making the resonant frequency of a trap fall outside the bands of interest.

The trap is probably self resonant below 40m... but that is just a guess from experience of having designed such things.

This is not a trap antenna:

1)- At 40 meters the coil works like a medium impedance insulator,76uH
represents 5300 ohms.

2)- At 80 meters, the antenna works like a vertical mobile antenna, the
coil resonates with the 2.3m section.

I made several of these antennas years ago, and the 40 meter section is
always longer than in a simple 40 meter dipole.

Hi
I have a sauna with electric heater 7000watts. Nice area on top to put some rocks and I see others have suggested lava rocks. What if I put granite or limestone? That is what I have there now, they haven't cracked or exploded after spraying water on them. They look nice, some red, some different colors. Is there any harm in using granite or limestone apposed to using lava rocks? I am sure they were all the same a few million years ago,,, any reasons why I shouldn't use the granite or limestone rocks? Radiation? Emmisions of sometype? inevidable that they will explode? nuclear meltdown of some kind? I figure the temperature is around 200 or 300 degs.

Any thoughts please and thanks?

Hey, sorry it is off topic,

But received intelligent advice here before, thought I could hear some thoughts.

To answer a bit of my own question, I found that certain granite rocks handle well up to 800 degs. I thought regular iron turned red about 700 degs. The rocks I have are simply right from the river side and not been treated or anything. Just curious as to other concerns or issues that may come to mind. Maybe I will tell you in about a year what the experience is. Maybe too simple a question.

73s

Ok, Ok,, I will go

Wow, not a very friendly group.

But I did manage to learn a lot about the rocks this evening, I got a lot of opinions from googling, mostly of dealers with their opinion. Some had bags of granite rocks for 80 dollars, plus shipping, plus taxes.

I will still watch the group for any interesting comments from those in the know, any interesting point or opinion is appreciated.

Any fungsua people?

73s

We tolerate (sort of) off-topic wandering/rambling/babbling by regular posters.

Try going to a geology group and asking them about ham radio. Or go to a Led Zeppelin Group and ask about Sixth-Century Bhuddist funerals.

See how that works? There needs to be some linkage.

Sorry some of our group were abrupt with you.  That was rude.

On the other hand, you do understand that this is an ANTENNA discussion
group, correct?

When you ask about things that are absolutely not on the menu don't
expect nice answers unless you ask very nicely and don't have an attitude.

No problem gents,,

I did look into the geology groups and none were active, active on my news server. And I have learned a lot from this group, lots of knowledge within this group, I have made all my antennas. I completely made my sauna, right from scratch. I was simply curious about the rocks, if there were any theories as to their selection or why some were selected over others. I supposed it is a matter of preferrence. Did you know that rocks age several thousand years each time you heat and cool them? In accourdance with errosion? And I also learned a lesson in feng shui as these rocks cause a situation better than viagra, as when my asian gf came into the sauna with me there last night, well, lets just say we learned a few things there. None of the rocks exploded, I intentionally coolded a couple of them instantly in a bucket of ice water then back on the stove then cooled and nothing cracked or exploded like I read somewhere. Some of them were turning colors but I might attest that to the fluid replenishments, But still a bit curious why some sauna places scream about lava rocks, and forbid granite rocks, while others sell granite rocks. I suppose about 4 million years ago they could have been the same. So any geological advice from anyone in the know is awsome. 73s

Hmm, let's see, crystals are often referred to as "rocks" so maybe it's a
stretch, but ...

And granite contains quartz, a constituent of crystals.

And he/she has been polite in spite of some of the responses.

Tuuk, we aren't all ARs.

Yes, there are many legends in their own minds on this group.

What intrigues me is why, when a post is considered 'off topic,' even labeled 'Off Topic...' the reader doesn't just move on to the next post but has to respond with some nasty, snarky, demeaning bullshit. I guess some people are just wired so they have to feel superior even though their behavior causes them to appear insecure and incompetent.

Hot rocks will crack when you pour water on them. That's why you need
igneous stuff like lava (at Barbecues Galore). Get a squirtgun.

Well, some sauna specialists prefer non-porous rocks to others, I am not
sure if the translation "soapstone" is known or correct, but it's dense,
not porous as limestone and has good thermal storing property.
Granite probably don't break easily as it's hard and solid, but
thermal storing properties are not the best.
The one popular stone used is the olivine, there could be several
variants of it.
Don't know the availability of "soapstone" in your area or the price of
it in your quantities but it could be one choice to try, at least on top
layer of stove.

Not inevitable, but entirely possible, and with potentially bad consequences (e.g. "flying hot rock fragment puts out somebody's eye").

Granite *may* be safe enough, as it's a metamorphic rock which has been heated to high temperatures at least twice in its lifetime. Depends on whether that particular granite has cracks in it (some does), how much moisture or water it has been exposed to, etc.

I would avoid limestone, as this is a sedementary rock which is deposited from water and has quite a bit of water bound up in its structure.

It's really a question of "How lucky do you feel?"

Thanks all, great tips.

Still trying to figure out somethings on this sauna, it is one of those home made from scratch things.

I appreciate all advice. Excellent group, lots of knowledge here, I have benefitted from your advice in the past,,, and I will in the future.

Thanks again and 73s

Best regards

```

or C from the winding of the coil to the surrounding tubing.

Or the "self C" of the coil (viz Medhurst's formulae for self C of an inductor)

There's a goodly bit of empiricism in trap design. You can use basic physics to calculate, but there's enough non-idealness in most construction techniques that the calculations get you to a starting point. (e.g. you could model the transition from the antenna element to the coil in the trap with a lot of detail, or you could just build one and try it, then adjust)

> Note that measuring the impedance of traps is very challenging.

>
> That explanation is appealing, but limits your options. There are advantages is making the resonant frequency of a trap fall outside the bands of interes

Here's a (not very realistic) example of how it might work

Say you want an antenna that covers both 10m and 15m. You start with a 10 meter resonant antenna. Now hook a trap which has very high impedance at 10m on the end of it. Since it's high Z, not much current flows, so it doesn't change the 10m behavior very much. But, you also want it to work at 15m. So you figure out how long an additional element you need to put "outboard" of the trap to get the system to resonate. Typically, the trap is a parallel LC, so below resonance, it looks somewhat inductive. Since a short element looks capacitive, the added length for 15m will be shorter than it would be without the trap.

There's a whole raft of design approaches about where you put the resonance relative to the frequencies of use, and how you want the current distribution to work, and then there's all the "what's practical to make and manufacture" and "tolerance to misadjustment/weather/aging".

You can get a pretty good start with a modeling code like NEC, but eventually, you've got to go out and start fiddling in real life, because almost all traps are not precisely modeled by NEC for a variety of reasons.

granite is igneous. gneiss is metamorphic from granite.

The hazard is, as you point out, voids full of water that superheat, and
then flash to steam. Sort of like the spalling from lightning current
flowing through corroded bolts in concrete.

So it depends more on the structure of the rock than precisely whether
it's igneous, sedimentary, or metamorphic.

Hi b�o-master

Here is a simple trap antenna design tool that I have successfully used
a few times:

<http://www.k7mem.150m.com/Electronic_Notebook/antennas/shortant.html>

Impedance is not a simple scalar quantity as expressed above. The 'specification' is incomplete, you would need to ask the sellers what they meant.

If for example, they mean the R component only, do they imply that X must be zero, or that X can be any value?

If they mean the magnitude, do they imply that any angle of impedance is acceptable?

Also missing is any bounds on efficiency.

I have heard from time to time on air, OMs boast that their tuner is so good, they have matched it up with no antenna plugged in. Obviously, efficiency is zero in that case. A tuner with lower internal losses might not achieve the same feat.

Did you miss the word essentially?

Since it bothers you. From LDG "Start Line." Ground this from an external switch or open collector to initiate a tuning sequence by the external tuner.

And "Key Line" This is similar to a PTT line to the transmitter, but in this case tells the transmitter (which is capable of doing it) to, regardless of mode, transmit a low lever CW carrier.

When the key line changes state because of a request to tune, it turns on the transmitter. When tuning is complete, the key line toggles back to it's normal state.

> Though the protocol is not published by Icom, and the implementation varies
> a little from radio to radio, the four wires are usually labelled and none
> are "tune complete".

If you put an indicator such as an LED on the key line watching it change state is a pretty good indication of "I'm tuning" and "Tune complete" regardless of what it's called.

Do you just like to argue? These are published specifications from the manufacturer. If you have an issues with the validity of their claims, take it up with them.

I suspect both Icom and LDG took the time to play with resistive loads to verify the tuning range. If that is the case, then yes, it's a simple scalar quantity. I doubt they took the time to fiddle around adding a reactive components to the test loads otherwise they would haved published a Smith Chart with a "We can match anything within these bounds" as the specification for tuning range.

I am aware that a frightening majority of licensed amateurs wouldn't be able to pour piss out of a boot with the instructions printed on the heel. Perhaps you're unaware tha I'm not one of them.

The /KEY line can be used to initiate a tune carrier, it is used to sustain the tune carrier until the tx aborts or the tuner ends the process, and it is used by the tuner to signal whether the tune was or was not successful.

As someone who is a linux bigot (within the linux world, not talking
about other OSs) I finally had to admit that Ubuntu was ok.

But the current release is not.

I would advise you stick to the 10.04LTS (long term support) release.
Ubuntu 11.xx threw out the GNOME desktop and replaced it with rubbish.
I know no one that likes the new desktop that has used the old.

We can only hope that by the time 10.04 is deprecated that GNOME will be
back.

I have 10.04. Having only half the recommended RAM (per stated system
requirements) means I'm flogging the hard drive.

```

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

The current version allows you to easily revert to the old desktop if
you want. I did. But IMO there is not that much overall OS improvement
to do the upgrade unless you just want to try it which is why I did.

In Windows I use Firefox with the QuickJava extension. It puts on/off
buttons at the bottom of the browser window that make turning on and
```

off browser functions (flash, java, javascript, ect) quick and easy. When exploring I only leave text and images active. If I find a site I want to chance that needs flash or script I just turn it on and refresh. It's not foolproof of course but a different approach. And if I'm just reading text sites (newspaper, forums ect) I leave everything off but text and images and most of the flashy moving annoying ads which I hate are disabled which also improves the page loading time a bunch.

11.04 did. 11.10 does not. I'm sticking with 10.04 LTS. The new desktop
is for morons. They are obviously trying to appeal to tablet-brains.

Ah, I didn't realize 11.10 was out. My 11.04 is busted in that it won't update so perhaps I'll take your advice and go with 10.04. Yes I really tried hard to like that new desktop but just couldn't hack it (pun intended) in the end... ;)

Nice. But that has nothing to do with what I was talking about.
Windows is, well, Windows. And X windows is Unix.

Neither have anything to do with browsing per se.

That sounds like a lot of work. I try not to take the wed too seriously.
Like everything, it's 95% BS.

The Unity desktop is usable, but not for me. I don't think it was
designed for tablets. Methinks it was an attempt to use the "extra"
screen space afforded by 16:9 displays. In effect, it leaves the menu
on the left side of the screen most of the time. I switched back to
the older Gnome 2 desktop on 10.04 and am living happily without
Unity.
<http://www.geekgumbo.com/2011/05/04/switching-the-unity-desktop-to-the-gnome-desktop/>

On Fedora 15, the new and improved Gnome 3 is in my never humble
opinion a step backwards. The designers apparently decided that
configuration options should now be either well hidden, or
intentionally misplaced in non-obvious places. Some of the logic is

amazing. For example, requiring a logout before a restart. Is there
a problem with killing user processes that justifies this?

Meanwhile, KDE 4.6 seems quite good (I haven't used it much) but
really gobbles RAM. I also tried Mac4Lin with 10.04 and had problems.
Oh well.

At least we're not spending $160 for the privilege of BSODs! I like Puppy
Linux, which I believe is GTK on top of Ubuntu. Not pretty but incredibly
responsive. Will run on anything from first gen Pentium.

I haven't seen many BSOD's on Windoze boxes in maybe 10 years. The
only time I see them is when I'm playing with drivers or when I'm
trying to untrash the filesystem. I look at it differently. $160 is
a bit over 2 hours of my billable labor rate. If Windoze saves me 2
hours of time, I break even.

I think the desktop manager in Puppy Linux is JWM
<http://en.wikipedia.org/wiki/JWM>
apparently on top of Ubuntu.
<http://www.desktoplinux.com/news/NS5855706811.html>

I like AntiX for small footprint machines.
<http://antix.mepis.org>

PII with 128MB is about the minimum usable config although it will allegedly run on older CPU's with 64MB.

Features and functions get added faster than bugs get fixed. The end result is a bloated and buggy machine, full of useless features, that runs at the speed of a snail. This applies to Linux distro as well as Windoze and OS/X. "Bigger, Better, Faster.... pick any two".

You can run J Window Manager or GTK at the click of the mouse and a
restart of X Windows. If someone wants me to do Windows things they have
to give me a Windows box to do them on. I have an Atom netbook with XP I
use to feed my iPod. None of my ham radio stuff requires Windows. None of
my audio production requires Windows.

I use "BSODs" generically for any unrecoverable error that the 3 Finger
Mickey (or "Kill") won't fix.

Well, since you haven't been using Windoze much, you probably haven't had much experience with its stability. In my day job, I fix computahs, mostly running various Windoze mutations. I get very few unrecoverable errors, hung processes, comatose peripherals, or general weirdness, if the machine is in fairly good shape. No points for static electricity fried RAM, overheating CPU's (AMD early Athelon), buggy apps that won't die (Acrobat Reader 10.x and Skype), overly aggressive backup programs (Memeo), or various sync programs that fumble over their own semaphores (iTunes, MS ActiveSync). If I try hard, I can hang a Windoze box running any of the aforementioned. If I run alternatives, or run them in a VM sandbox, no problem. If uptime is your standard for reliability, then I can offer several weather stations running Windoze 2000 that typically stay up for months. For my personal assortment of machines, I only reboot after an update, or after a sufficiently large number of config changes to make sure I still have a working system. When a customer drags in a system that is acting "erratic" and tends to hang, it's usually either malware or the all too common bulging capacitor problem. Cleaning up the malware and replacing the bulging caps usually stabilizes the system. Incidentally, I only reinstall windoze from scratch if the malware has made such a mess that it would take me longer to fix than to reinstall.

Unless that sentences you to lots more hours later.  Then you cost
yourself.  Beware the easy path.  Or at least research it.

I have to say the front end investment on Linux has been proven to be a
better investment than Windows "ease of install" and nasty programming
environment.  For instance dot net does seem to leak.

Been there, worked all sides of the argument including Apple and I'll
take Linux and Apple in that order.

Actually I misspoke there. I have hard evidence that some parts of dot net leak. We are fighting a nasty problem at work because of that.

Managed code is not all it's cracked up to be. Especially when from certain software houses.

Funny, but my experience has been a lot different. Every month after Patch Tuesday, the phone lines would light up, as people's computers would stop working, or specific programs would stop. Some times it was because Microsoft would turn off something that was supposed to be a security problem, which just happened to be a needed feature for a program. I had one computer that every time it reached a certain place in the upgrade cycle, it would hose the OS, requiring a reinstall. Had to take a perfectly good computer off line. Even aside from instability issues - and a computer that might work one day, and not the next for no good reason is unstable - there were issues like killing DVD codec for Windows media player. Yeah nothing like a serving of pissed off users wondering why they couldn't play that demo DVD at their important meeting.

The fact is, my Windows computers had one problem after the other, while my Mac's just tended to chug along, and their users said we could take them from them after prying their cold dead fingers off them. Same for me. I supported Windows, I did as much of my work as possible on the Mac.

There was 1 (one) case where an update made a problem for the mac users.

Windows? Couldn't even count.

Now that I'm retired, I will only be doing computer support for my family, and as my Windows Desktop just died last week, I'm going to be replacing it with a yummy 27 inch IMac, and the laptops will all be running Linux.

Free at last! Thank God Almighty, I'm free at last!

All apologies to MLK>

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

 radio/personal-intro

```
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article       |
is that it does not mention newer amateur radio newsgroups created since      |
it was written, including:                                                    |

 rec.radio.amateur.antenna                                                    |
 rec.radio.amateur.boatanchors                                                |
 rec.radio.amateur.dx                                                         |
 rec.radio.amateur.equipment                                                  |
 rec.radio.amateur.homebrew                                                   |
 rec.radio.amateur.moderated                                                  |
 rec.radio.amateur.space                                                      |

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions.  We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Not my pain or my decision. My customers are the Windoze users. I also have a few Linux users. Mostly they run Linux servers and a few desktops. In almost all cases, the decision of the OS is made by the applications vendors or whatever apps the hired help is familiar with using. I have little say in the matter.

One of my bad jokes is that I would be out of business if Microsoft had done a better job. There's quite a bit of truth to that.

>I have to say the front end investment on Linux has been proven to be a
>better investment than Windows "ease of install" and nasty programming
>environment. For instance dot net does seem to leak.

I'm not a programmer, and therefore not qualified to comment on the relative merits of programming environments. However, I have had to deal with the multiple mutations of dot.nyet. It sucks. It's quite common to have to uninstall all 4 mutations of dot.nyet, with a 3rd party app, and reinstall the whole mess from scratch. I also have a suspicion that dot.net is responsible for some bizarre application

crashes. I've seen memory leaks, but they seem to be coming from the
apps, not the libraries.

>Been there, worked all sides of the argument including Apple and I'll
>take Linux and Apple in that order.

I prefer Windoze, Linux, and Apple, in that order. My choice has
nothing to do with the quality of the product. It's in order of which
OS will make me money, and continue to support my decadent and lavish
lifestyle. Windoze needs help, I provide help, and therefore I make
money. At the other end, Apple users assume that if anything goes
wrong, it must be their own fault, and not that of the OS or apps.
They'll only ask for help if they're really desperate. Since I'm not
Apple approved, blessed, and authorized, I can buy parts or get inside
info. I'm also competing with AppleCare. Linux is a mix of the two.
Setting up complex SNMP monitoring and performance tuning is what pays
the bills. Dealing with hardware incompatibilities, is another Linux
favorite.

It's 100 percent true. An Apple costs more than a Windows computer - although not all that much when comparable performance is taken into account, because the Apple mentality does not sell computers that are ready to be obsolete, such as the horribly underpowered Vista basic machines. But I digress. The people who own Windows computers that I work on manage to feel that they have gotten a better and cheaper deal, when in fact, by the time they have paid me for a few fixes, they have surpassed the cost of "That pricey Apple computer". They also tend to quote the price of some half a$$ed cheap PC and something like the 27 inch i7 iMac when comparing prices. Check ot the high end Sony all in one, then we can talk about prices in more of an apple to apple fashion 8^) (not that you've complained about Apple prices AFAIK.

In in the professional world, no one seems to add the labor cost of the armies of support personnel needed to keep the Windows machines running. Adds a tad to the price.

I beg to differ. In 2009, I went through some effort to compare Dell
and Apple computahs selling just before Christmas time:
<http://802.11junk.com/jeffl/crud/Mac-vs-PC.xls>
Only the 13" MacBook was fairly competative with the equivalent Dell.
In all other cases, Apple was twice as expensive as Dell. I went
through considerable effort to get all the hardware as identical as
possible, but there are some discrepancies. The big one is that the
cost of the firewire port is not included in the PC pricing, because
few PC's actually use firewire. I plan to bring the spreadsheet up to
date sometime in November, when Christmas prices and goodies appear.

>because the Apple mentality does not sell computers that are
>ready to be obsolete, such as the horribly underpowered Vista basic
>machines.

Interesting. My customers problems seem to revolve around hardware
and software that was insufficiently tested and is therefore infested
with bugs. The problem is not that either was obsolete. It was that
they were permaturely released. Since whomever makes it to market
first usually wins, it's understandable.

>But I digress. The people who own Windows computers that I

Well, you're entitled to your opinion. I don't consider paying for
repairs in advance in the form of AppleCare as a great improvement.
I'll be sure to include the 27" iMac in my comparison, but it might
not be against an overpriced Sony. Nobody else has a 27" so I'll
compare the smaller screens. Very roughly, the Apple 21.5" iMac
starts at $1200. The Dell Inspiron 2320 all-in-one with a 23" screen
starts at $950.

>In in the professional world, no one seems to add the labor cost of the
>armies of support personnel needed to keep the Windows machines running.
>Adds a tad to the price.

I don't have much contact with IT except when they get into trouble.
As far as I can determine, most of IT consists of supporting users,
not machines. As near as I can determine, the level of user support
is about equal, whether Windoze, Mac, or Linux.

I'm not that sure about that.   At work we still have Windows XP machines
bought in 2001, and while they are very slow they still work and can
be used e.g. as Citrix terminals or for Microsoft Office 2003.

They still receive security updates from Microsoft.

Apple machines from that era are long obsolete and receive no support
at all.

A few weeks back, I solicited info on a vertical antenna mounted on a metal patio cover. Here's the story to date.

First, I put up an Outbacker by using a standard automotive rack mount clamped on the conduit above the metal patio cover. The Outbacker was installed simply because it was easy to do, and I have one. Results were similar to what would be expected from an Outbacker mounted on a car. There was an unacceptable amount of cordless phone interference on 20 meters. Performance was acceptable on 10-15 meters.

Next, I removed the Outbacker and installed a 8.5 foot whip antenna. The antenna is resonant at 27.8 Mhz with about a 1.1 VSWR. At 28.5 Mhz the VSWR measures 1.8, and at 24.9 Mhz measures 2.3. Measurements were taken through about 30 feet of RG-58.

Performance of the whip is quite good on 10 and 12 meters. 12 meter performance seems better than 10 meters, but it isn't clear that propagation conditions influenced the outcome.

More experiments will be performed, but so far, so good. The unloaded whip is a simple way for me to operate on 12 and 10.

I looked at the all in one's. Dell doesn't even sell an i7, or even an
i5 Biggest they have is an i3, Don't have a 27 inch monnitor, don't have
a 1 TB hard drive. In addition the all in one Mac's have non-laptop

components.

That's the issue I was referring to, Jeff. the Mac is called "too expensive", and it is compared to a machine that doesn't exist, so a cheaper machine is trotted out as a comparison.

So yes, the Mac is a whole lot more expensive than a machine that is a whole lot less capable. And infinitely more expensive than a machine that doesn't exist.

As I said, the closest thing I found is a Sony, and it's over 2K for a much smaller screen. Do not want.

> The big one is that the

I do use firewire. And will use Thunderbolt. Check out the specs vs USB3.

Mine tend to revolve around security issues, and updates that turn off needed functions to "enhance" security. As I joke with them, I note that the most secure computer is one that doesn't work any more.

>> But I digress. The people who own Windows computers that I

>> one, then we can talk about prices in more of an apple to apple fashion
>> 8^) (not that you've complained about Apple prices AFAIK.

> Well, you're entitled to your opinion. I don't consider paying for
> repairs in advance in the form of AppleCare as a great improvement.

Don't use Applecare, and don't need it. The one issue with the bad Rubycon caps a few years back was taken care of via recall. And that hit many manufacturers, Dell included. I did have a server power supply go bad once. Haven't counted the PC machines.

> I'll be sure to include the 27" iMac in my comparison, but it might not be against an overpriced Sony. Nobody else has a 27" so I'll compare the smaller screens. Very roughly, the Apple 21.5" iMac starts at $1200. The Dell Inspiron 2320 all-in-one with a 23" screen starts at $950.

And there we go. I use a 27 inch Imac at work, and I don't want another dinky screen.

As far as my outside computer support goes, I can make up that difference in a short time. A couple service calls, and they might as well spent the extra money on the Mac.

Or they can try the Geek Squad.

>> In in the professional world, no one seems to add the labor cost of the armies of support personnel needed to keep the Windows machines running. Adds a tad to the price.
>
> I don't have much contact with IT except when they get into trouble. As far as I can determine, most of IT consists of supporting users, not machines. As near as I can determine, the level of user support is about equal, whether Windoze, Mac, or Linux.

Windows and Mac. Windows is around 95 percent of the work. The biggest problem on the Mac side is the permissions, a side effect of switching to a Unix based system. If not for the Windows support, I wouldn't do support at all (permission fixes take mere seconds. Weird situation, since I'm actually a videographer.

but yeah, I'm entitled to my opinion, and you are entitled to yours. If you want to compare lesser Windows machines to Mac's have at it.

I do have the experience of working a lot with both types - actually Linux too, but only at home. A lot. 8 hours a day with the Mac, maybe 6 a day with Windows. I don't dislike one or another, but I do put a premium on the thing working. My Mac's work a whole lot more, and allow me to meet my deadlines much better than the Windows machines. And that part is fact, not opinion.

Don't think I was arguing about that. If you can run XP on the computer, M$ will send updates. Be careful though. I had a HP Pavilion, bought in 2005, and at one particular point in the update process, it gets hosed. I ended up having to take it offline after the third time it happened.

My G5 machines still get updates.

Look, if you want, use the Windows machines. I don't really care. I do have in depth personal experience with both, and if my job was to support the Mac's I'd be out of a job. With the Windows machines, there is a lot of job security. Believe or do not believe.

My favorite part of working with the Windows fans is when I talk about someone getting a virus, or an update hosing their machine, the first thing they say is "Oh, I've never gotten a virus, then they go on to describe "there was this one time" and tell about how they got some virus that they had to wipe the drive to cure (or somesuch)

If you are happy with Windows, and it never gives you any problems, then by all means use and enjoy.

Taking a break from computers, I had an actual practical question about an antenna. Sort of hypothetical, but maybe some practical use.

Situation:

Yard with a maximum antenna possibility of 100 feet. Height around 60
-70 feet.

All band is desired

in line with that, a decision to run ladder line (not window line)

Obviously, a tuner will tune the antenna.

But an antenna cut for somewhere in the 75 or 80 meter band is often
touted as a good length, around 130 feet for this antenna.

Is there an advantage to loading the antenna to place it in the band,
and tune the rest, or just to string up in the available space?

Perhaps something to allow it to une easily on 160?

Or, is there anything that would contraindicate using this approach?

Vertical antennas work great if you get them a few feet in the air. I
need a second antenna for the higher HF bands, I may try a 102" whip
myself.

Mike,
Would it work? I think it will certainly work. That doesn't say how -
well- it would work, naturally, but you could put some kind of signal
on almost any band.
One option with that 100 feet and an 80 meter 'length' is to just drop
about 15 feet straight down (or tilted?) on each end of that 100 foot
span. That might even work for an 160 meter 'length' but not real
well, sort of, who knows?
One option on making something link that 'tunable' is by varying the
feed line length. Or, have a really 'capable' tuner. I doubt if it
would be the "best" radiator in the world, but it can certainly be
made to work.
 - 'Doc

(Wish I had that 60 - 70 foot height capability!)

As offered, dropping ends.

>Perhaps something to allow it to une easily on 160?

The 80M length with tuner shouldn't be a problem.

Didn't mention it, but the top of the patio cover is at about 9 feet. It is
about 16 feet by 25 feet.
The whip is a cb whip that I was going to cut to length on 10m. After
trying it on 10 and 12 through a tuner I decided to keep it as is.

Indeed it is stated as the minimum length andtenna (being a half wave on
the lowest operating frequency), fed with open wire feed of any type, and
touted as a no-brainer, you can't go wrong.

As with most simplistic advice, it is flawed.

You gave lots of info on the system, well done, but ommitted the preferred
feed line length.

It may well be that your preferred feedline length should dictate the
dipole length.

In theory, for 80m use, I don't see much benefit to cutting it exactly
for 80m. The difference in matching loss should be fairly unnoticeable
as long as you are in the general ball park.
Ladder line should be pretty low loss, even with a high SWR.
So if there were to be excess loss, it would likely be the tuner.
And in this case, I don't think the difference would really be
noticeable on the air.
But... If it were me, I'd probably cut it to length anyway. But only
for the reason that I might decide to use coax at some later
date, and could still use the same wire. Or.. at least make it
too long, not too short.. That way it could be re-used with any
kind of line. But, maybe I'm just overly cheap and hate to see
a perfectly good stretch of wire go to waste..   :/

For 160 use, I'd feed it as a single conductor. Either short the
feed line, or feed just one leg. I'd generally prefer to short the
feed line to add more top loading. Makes it act like a T vertical.
If you fed one leg, it would be like an inv L. Either way should
be easier to match with a lower loss than trying to feed it as a
1/2 size dipole. The tuner loss will get you in most cases trying to
do that.

Lessee, I have  standoffs holding the present window line, and can back
of the envelope this. five feet to the roofline, then 25 feet to
transition to where it heads verticaly. Then allowing for some droop,
I'd say another 40 feet given the 20 foot roof height.

So we're looking at around 90 feet total, not counting the foot or so in
the house.

> So we're looking at around 90 feet total, not counting the foot or so in the house.

One of the risks of using a centre fed dipole with arbitrary open wire feed is that you may find the impedance at the tx end of the line to be extreme on some bands, driving problems with volage baluns, and ATUs.

In the case of a 80m half wave, feedline lengths near 60' and 180' are likely to be troublesome. Same dipole on 40m and feedline lengths near 60' and 120' are likely to be troublesome.

Some folk would advise feeding at a current maximum, but of course, for this dipole, a current maximum for 80m at the tx end of the feedline is a voltage maximum for 40m.

Your 90' option might well be effective in avoiding some of the impedance extremes on the lower bands that damage componets, cause excessive loss, or are just difficult to match.

Make it 102' and you could hang a G5RV for 75m, 40m, 20m & 12m.

> Or, is there anything that would contraindicate using this approach?

The SWR on the ladder-line will be very high (~30:1) on 75m and too
high on 160m. When a dipole is less than 1/2WL on the lowest frequency
of operation, the feedpoint resistance goes down and the feedpoint
reactance goes up as the frequency is decreased. As the antenna-length/
wavelength ratio goes down, the SWR goes up. Here is some information
on a 130' all-HF band ladder-line fed dipole.

http://www.w5dxp.com/notuner.htm

One could short the ladder-line wires together and feed the antenna
against ground for 160m operation.

The support costs I've noticed, starting with IBM 360/65 (1973), are people followed by people followed by people. Somewhere below the people is hardware.

Been in the middle of it since 1975 starting as a programming assistant in a college data center. Where we presented decks to the priests.

As a programming assistant the most frequent things I saw were questions from the grad students like - "How do I make it fit?", "How do I make it fast?", "Why doesn't it work?". Users who would spend 18 hours a day dug into the math of what they were trying to solve, but refused to spend 4 hours once learning the tool they used to solve the simulations.

I knew nothing of what they were trying to prove. But I always managed to get the programs to fit, run fast as possible, and not "doesn't work".

Some things never change.

Mysql is malware itself, purporting to be a relational database, written
by people who couldn't be bothered reading a book (for example) to learn
what a transaction is. More harm and data loss can be blamed on people
trusting it than on any malware.

> Just acquired a couple reels of electric-fence wire from someone who got smart and got rid of her horses. Question: is this wire (seems to be aluminum) useful for antenna applications?
>

I have lots of electric fence wire that is aluminum. I like it because it's easy to handle.

However, I have never tried it for antenna wire. It is quite soft and stretches a lot. I suspect it would be fine for a 40 meter dipole, but for anything lower in frequency it might continue to stretch under it's own weight, plus a center insulator, balun and coax weight.

Try a length suspended at 5-6 foot and then add some weight in the middle to simulate the coax and other stuff and measure the sag to ground over a week or so time period.

Paul, KD7HB

Missed this whn I first read it.

Seems a polyurethane coating would render the wire useless in an
electric fence use.

That is an issue for annealed copper which is probably the most popular
conductor amongst hams, especially in small diameters.

One of the things that happens is that as the copper yields (stretches), it
work hardens, increasing its tensile strength. So, if the forces are not
too high, it might yeild a little, become a little thinner, a little
longer, a little stronger and survive (for now).

At some point, the increase in tensile strength of the copper does not
offset the reduction in cross section area and the stretch continues with
lower tension until it breaks.

Soft aluminium wire would not seem to comply with the NEC clauses for
antennas, though they are apparently widely ignored.

I collaborated on an antenna project where Gallagher XL HT steel cored 30%
aluminium clad wire (2.7mm overall) was chosen for long spans in a place
subject to high winds, snow and ice. It was well suited to the task, RF
conductivity similar to 2mm HDC IIRC, and much stronger.

Owen

I tried 16 gauge Al wire and it was too soft & weak for anything. I
use it for bundling stuff now.
I would sure hate to depend on that to keep the bull next door!

It'll probably be okay with 50kV applied to it.

being Linux doesn't disqualify it, but having no support for other OSes
sort of does..

At least it has a command line interface (useful for the remote end,
which is a small Linux box) (bearing in mind the author's warning:

     Those options are useful for quick launch (at least for me ;),
     but I don't think it's a good idea to use them (they might be buggy),
     in the future I may use standard GNU getopt, but for the moment
      please use the graphic interface instead.
```

And it has a variety of flavors. And it might be possible to compile it
to run under OS-X or windows (not in emulation or VM, but using a
useful library)

The real gripe I have is that the data format isn't described anywhere
(at least not that google can find). reading through the source code
finds stuff about headers, stream sync, etc. but there's no obvious
description of what the UDP/TCP packets look like. In fact, there's no
comments in the source code, for the most part.

So if you DID want to write your own endpoint, it would be mighty tough.

It's still a math problem. You can predict intermod products from known
frequencies whether the non-linear device is active or passive.

I'm not sure what you mean with data format, but I assume you are
talking about the audio stream. IHU is just a simple interface to
Speex, http://www.speex.org/, and that is a free audio compressing
codec, at least free in the sense of BSD License.

The documentation for Speex is rather comprehensive, and it covers the
RTP format and the API.

Hmm.. Appendix C of the Speex doc does provide a RTP example. However, IHU doesn't say anywhere that this is what it does (it does say it uses speex for compression). It's also not clear that IHU is actually using RTP frames. It seems that IHU has its own homegrown packet format:
(in packet.cpp)

```
  ARCHITECTURE OF THE PACKET
  *
  *  A IHU packet consists of 2 parts:
  *  1) Header
  *  2) Data
  *
  *  THE HEADER
  *
  *  THe header is made up of 3 parts:
  *
  *  a) SYNC Pattern (3 bytes)
  *     The pattern consists of the fixed ASCII string: "IHU"
  *
  *  b) Packet SIZE (1 byte): unsigned char that contains
  *     the size of the packet (min size 5, max size 256)
  *
  *  c) INFO data (1 byte)
  *     It contains those informations (in order):
  *     - OBSOLETE: still used for bakward compatibility (versions < 0.6.x)
  *        Speex mode (3 bits). It can be:
  *        IHU_INFO_MODE_ULTRAWIDE
  *        IHU_INFO_MODE_WIDE
  *        IHU_INFO_MODE_NARROW
  *     - Packet type (5 bits). It can be:
  *        IHU_INFO_RESET 0x0
  *        IHU_INFO_INIT 0x1
  *        IHU_INFO_AUDIO 0x2
  *        IHU_INFO_CRYPTED_AUDIO 0x3
  *        IHU_INFO_KEY_REQUEST 0x4
  *        IHU_INFO_NEW_KEY 0x5
  *        IHU_INFO_ANSWER 0x6
  *        IHU_INFO_CLOSE 0x7
  *        IHU_INFO_REFUSE 0x8
  *        IHU_INFO_RING 0x3f
  *        IHU_INFO_RING_REPLY 0x3e
  *
  *  d) Data LENGTH (1 byte): unsigned char that contains
  *     the size of the following DATA part (min 0, max 250)
  *
  *  THE DATA
  *
  *  This part of the packet is of variable size (min 0, max 250 bytes)
  *  and it contains the data to be trasmitted.
  *  It can be absent (if the packet doesn't need to transmit any data)
  *  or, can be audio data or keys for encpryption.
  *  The type of data transmitted is specified in the INFO header
  *
  */
```

anyway.. the point is that while IHU probably works just fine, it's like a lot of other undocumented utilities out there: it works for what it's original author intended, and if you want to use it as a basis for software that you'd write, it's great.

However, my whole question was really to see if some simple off-the-shelf multiplatform already existed. (i.e. I'd rather spend my time doing things OTHER than writing audio transport code)

You are probably right. I've used IHU to see if Speex was good enough to use as an audiolink. I didn't scrutinize the source code. I am planning to establish a link between my noisy home (Stockholm) and my summerhouse. Anyhow that good suitable audiolink software has yet to be written ;)

Yep. And after I've done the math, I still have to get rid of the intermod. The problem is not the math. That's well known and easy to do. The problems are:
1. Finding which of the hundreds of signals found on a typical mountain top is causing the problem.
2. Finding where the likely culprits are located (i.e. which building).
3. Finding any and all sources of non-linearity that are producing the mixes. That could be anything from a gold on nickel connector to insufficient reverse power protection on a broadband power amp.
4. Site management and politics.

It's no longer single "known frequencies" causing the intermod. In these days of broadband everything, it's fairly wide swaths of digital noise that's causing the intermod. For example, CDMA phone is 1.25Mhz wide, WCDMA is 5Mhz, and CDMA2000 is up to 25Mhz wide. The worst part is that most of the culprits can't be decoded on my service monitor, so I can't tell for sure if they're causing the intermod.

Sure it has. Look up SVXLINK. It was intended to link a repeater with remote sites, but you don't actually need to have a radio on either end. It has full rig control with a serial interface, although one ham here built a USB one and I believe it interfaces to commercial ones.

It has remote receiver support with voting if there is more than one, remote transmitter support and a multiuser Echolink client.

It even has the capability to be controlled via DTMF tones built in.

Geoff.

The SVXLINK project is an intresting one if I want to do FM and or
ECHOLINK - repeater stuff. If I just want an an audiostream then
it's i.m.h.o just to bloated with these DTMF, CTCSS .....

Bloat is relative. It's a reasonably small program that runs under Linux, you probably could wedge it with the extras turned off onto an old router.

Gone are the days that speak freely was available, and you could run remote audio pickups via piping the audio via ssh.

```
(sendprogram) | ssh computer (receiveprogam)
```

Worked well for me to pipe a receiver in Jerusalem via frame relay to a remote speaker in Tel Aviv. This used 8k bits per second (plus overhead) of a 64k bits per second line.

Geoff.

I don't need to sound "impressive". I have been paid to conduct many
intermod studies using proprietary software.

> 1. Finding which of the hundreds of signals found on a typical mountain top is causing the problem.
> 2. Finding where the likely culprits are located (i.e. which building).
> 3. Finding any and all sources of non-linearity that are producing the mixes. That could be anything from a gold on nickel connector to insufficient reverse power protection on a broadband power amp. 4. Site management and politics.
>
> It's no longer single "known frequencies" causing the intermod. In these days of broadband everything, it's fairly wide swaths of digital noise that's causing the intermod. For example, CDMA phone is 1.25Mhz wide, WCDMA is 5Mhz, and CDMA2000 is up to 25Mhz wide. The worst part is that most of the culprits can't be decoded on my service monitor, so I can't tell for sure if they're causing the intermod.

Cellular phones are a different animal. I worked on fixed and mobile, mostly analog, mostly FM radios. Theory and practice are quite different.

The tower owner should have an inventory of every transmit and every receive frequency, plus all the standard I.F., plus nearby external high powered sources. The owner should have cleared each frequency before it went on the air, and should not add a tenant if doing so would create a harmful spur to existing users. This is site management 101.

I don't care how the WL people run their data streams. Cellular folks don't like high mountains (except for backhaul). I know they use very advanced techniques to hear signals below the noise floor; keeping that noise floor as low as possible is of paramount importance when you are looking at 100 mW devices in people's pockets 5 miles away.

FWIW, Tek has a real nice analyzer that will reverse engineer TDMA spurs.
make time-lapse spectrum analysis, and can even write on a map for you.

I'm curious, I'm in a marina that has an L shaped concrete parking lot
with water on the inside of the L<-- right were the arrow points.
I'm docked in the corner of the L, and want to send a signal everywhere
but the the water.
What does the pattern look like if I use a corner reflector but put
the source on the outside of the corner rather than the inside?
I'm at 433 Mhz now but may need to go to 2.4 Ghz.
The app is a driveway sensor that triggers a pocket carried receiver no
matter where I'm at on the L.
As it stands the transmitter range is not far enough, I only need 50
yards down leg of the L.
Mikek

>Theory and practice are quite different.

One day, you're going to eat those words, when you have to decide whether to follow theory or practice. When I find that they're different, it's usually because I'm doing something wrong. Also, if you understand the theory, you can probably figure out the practice (what to do). However, if you know the practice (i.e. seat of the pants engineering), you're highly likely to fumble somewhere.

You almost made me spill my hot chocolate. You're correct. Site managers should do all that. The problem is that all but one of the site managers that I know of are business types, not engineers. They hire engineers, tower jockeys, construction crews, and generally run the business. It's not unusual for me to get a call or email with "I just signed on to have [insert name] company put their radios in the building. I'll let you know if anyone complains". This translates to "Don't burn any billable hours doing calculations until AFTER someone experiences interference. In short, I get paid to clean up the mess, not to do the planning. If I want to enforce any engineering standards, it's also done post mortem. At best, I would get an email asking where in the building and tower I would guess the new radios should be installed, usually without telling me the frequencies or equipment. Interrogating the prospective new customer is something I try to do, but often they contract out the repeater service to a comm shop, which claims that they don't know anything because they're afraid I might steal the customer. I don't wanna talk about licensing, HAAT calcs, and coordination. Hopefully, your operation is a bit closer to theory than practice.

> I don't care how the WL people run their data streams. Cellular folks
>don't like high mountains (except for backhaul).

Generally true. The CDMA crowd doesn't like high mountains for the same reason they don't like CDMA operation in airplanes. The noise floor is much higher up high and there are not enough channels available to handle all the potential users if in a metro area. However, they do like medium high mountain tops with fairly well controlled coverage areas. They also like to share site ownership and management with public agencies to reduce costs.

>I know they use very
>advanced techniques to hear signals below the noise floor; keeping that

100mw is about the maximum that a cell phone can belch. Power control will usually keep that down to about 30-50mw.

>FWIW, Tek has a real nice analyzer that will reverse engineer TDMA spurs.
>make time-lapse spectrum analysis, and can even write on a map for you.

Well, the 20+ year old P25 radios are finally being forced into service by FCC edict, along with various incompatible TDMA implementations. Meanwhile, cellular is heading towards various CDMA spread spectrum technologies (CDMA200, WCDMA, LTE, etc), which makes TDMA look kinda dated. Anyway, I can't afford much in the way of expensive test equipment and usually borrow or rent what I need. I haven't actually seen a spur, mix, intermod, or noise on a spectrum analyzer for many years as the receiver sensitivities are well below the analyzer noise floor. Same problem with PIM (passive intermod). It takes quite a bit of power to produce PIM making it almost impossible to measure PIM while the xmitters are in operation. Trying to see PIM on a spectrum analyzer is futile.

I communicated sloppily; I mean the "theory and practice" of multiplexed
digital wireless is different than the "theory and practice" of SCPC

analog, e.g. your ability to see something meaningful on a scope.

http://www.tek.com/products/spectrum-analyzer/sa2600/

The scope is running Windows and can constantly compute intermod products (aka predict spurs) based on the real time environment. It has an option for advanced wireless signals. I could never get my boss to buy me one; they are enamored of Rohde Fish 313s.

Nice. I didn't know that existed. However, the way it works isn't anything magic that can't be done with PC controlled spectrum analyzer. It also seems to have some serious limitations when looking at broadband noise (i.e. CDMA). The SA2600 looks at the display and records all the frequencies and amplitudes that it sees. It then computes the likely intermod products. This would be really cool for sites where carriers come and go (i.e. frequency hopping trunking systems, cellular handoffs, FHSS). However, I didn't see anything in the notes on how it would handle a broadband signal. If it were smart, it would measure the upper and lower frequencies of the broadband noise, and use that to predict similar broadband interference bands. However, I couldn't tell from the destructions if that's what they're doing. The box would certainly be handy for "monitoring" the receive frequency waiting for the intermod to appear. Of course the signal levels would need to be well controlled to prevent displaying mixing products in the SA front end. Much of what I see in the way of intermod would never show up on a spectrum analyzer. For example, you're not doing to see PIM on a SA.

I don't think I can justify the cost on the basis of time saved. For example, I once isolated the source of intermod to another mountain top, about 20 miles away.

<http://nefl-dstar.com/blog/2010/07/01/the-fsh313-spectrum-analyzer/>
$11,000 spectrum analyzer with tracking generator and you're complaining? You should try using some of my antique test equipment and see if your opinion changes. I don't think I have anything newer than about 20 years old.

abt $9,200 street with tracking generator. I also had an Aerotron
(Marconi) for the bench. I am no longer keeping MiniCircuits in business.

Dunno, and I'm too lazy (and tired) to build an NEC2 model.  I don't
think it would work the way you propose anyway.

My guess(tm) is that you want to send RF in two directions, 90 degrees
apart.  That's easy.  Use 2 directional antennas, such as patch or
panel antennas, and drive them with a power splitter.  You'll get half
the transmit power to each antenna, but the receive sensitivity will
be the same as it would be with a single antenna (minus about 1dB for
the power divider loss).

>  I'm at 433 Mhz now but may need to go to 2.4 Ghz.
>The app is a driveway sensor that triggers a pocket carried receiver no
>matter where I'm at on the L.

Ok.  433MHz has very limited range mostly because of the crappy
receivers, gutless transmitters, and miserable antennas.  Improvements
to any of these will increase the range.  I suggest a better antenna.

>   As it stands the transmitter range is not far enough, I only need 50
>yards down leg of the L.

150 ft is difficult at 433Mhz.  My cheapo La Crosse weather station is
only reliable up to about 20ft.  My vehicle remote door unlocker is
good for only about 30ft.  However, it is possible to buy long range
433MHz remote control switches, with much longer range.  2.4Ghz is
fine, but what are you going to use as a receiver?

Anyway, look at commercial wireless car alarms and notice that the
better variety have a small bi-directional remote, that can act as a
pager to receive alarms, and also be used as a transmitter to
enable/disable the alarm.  These radios are probably better than
whatever you're using (and are probably on 900MHz).  You might also
consider using a real pager and a POCSAG encoder.

I would need to purchase a pair, transmitter/receiver. Thinking about it now, maybe I'll just get a walkie talkie set with a call button and hack that to trigger from the driveway sensor. I did that with my PUSH FOR SERVICE button years ago, worked fine until one of the walkie talkies died.

>

At one time I hacked my cordless phone system so my PUSH FOR SERVICE button closed the call button on the base unit and signaled the cordless phone I carried in my pocket. I was never happy with the range of my phone system though. The base is inside of my boat and the boat is a double layer of aluminum, signal does get out, but I'm sure it is attenuated.

I have had thoughts about removing the RF section of the phone and putting outside, but there seems to be a lot of wires. Don't know how it would work if I stuck 25 feet of ribbon cable between the phone and it's RF section. Might be able to get that down to 15 feet.

Seems like I buy a phone system every 3 or 4 years the buttons start getting flaky from living on the salt water. (the phone, not me)

So to state the problem;

I want to sense when a customer arrives and trigger an alarm I carry in my pocket at a maximum distance of 150 feet.

If I can get the distance, I like the phone idea because I can also answer phone calls.

I would attempt to run the RF signal outside, but I have not felt I know enough about the impedance's to get a net gain after attaching coax and an external antenna. Also I've noted 900Mhz transmit and 5.1 Mhz receive, or some such scheme. That makes the antenna difficult.

Just thinking in public :-)
Mikek

"Tiny Neutrinos May Have Broken Cosmic Speed Limit"
http://www.nytimes.com/2011/09/23/science/23speed.html?hpw

"the neutrinos raced from a particle accelerator at CERN outside Geneva, where they were created, to a cavern underneath Gran Sasso in Italy, a distance of about 450 miles, about 60 nanoseconds faster than it would take a light beam. That amounts to a speed greater than light by about 0.0025 percent (2.5 parts in a hundred thousand). "

I am impressed that they know the Permeability and Permittivity of that dirt path to 0.0025% at any time of year, and time of day, for any weather (for the speed of light comparison).

"Dr. Ellis noted that a similar experiment was reported by a
collaboration known as Minos in 2007 on neutrinos created at Fermilab
in Illinois and beamed through the Earth to the Soudan Mine in
Minnesota. That group found, although with less precision, that the
neutrino speeds were consistent with the speed of light."

They, obviously don't know their dirt (or it could be the effect of
10,000 lakes - umm, Italy has a lake district doesn't it?).

"Measurements of neutrinos emitted from a supernova in the Large
Magellanic Cloud in 1987, moreover, suggested that their speeds
differed from light by less than one part in a billion."

No dirt involved there (of course, I could be mistaken; it is a long
way without a rest stop).

I also had a good experience with LDG. They immediately shipped me spare relays and capacitors at a very low price (+ postage for international shipment).

Michelson-Gale dicovered in 1925 that The Earth's rotation effects the speed of light.
It becomes in agreement with SR.

So neutrinos travel with speed c and Gran Sasso with 0.3 km/s toward them.
The time to metting is shorter.

If the road is trough the Earth there no Michelson-Gale effect.

There may be the effect. But only in the time when the rotational speed is
towards to supernowa.

More info on measurements of speed of neutrinos

Recording of live web cast couple of days ago from CERN re measurements
http://cdsweb.cern.ch/record/1384486

Other info
http://public.web.cern.ch/public/
http://arxiv.org/abs/1109.4897 (can down load detailed PDF, "cast of
thousands" participating listed at start)

Be very interesting if results are confirmed

Regards

Eric R Gray (VK3ZSB)

The simple questions being asked (dirt being dirt and the tidal bulge
being triple the distance the neutrinos sped up) would seem to bury
that possibility.

Hi,
I have a big self supporting tower in the yard, it is grounded by grounding rods and of course itself. I am attaching two satelite dishes to the tower. The most practical way is using 2x4 wood, this will work great just screwing them to the wood and it will squeeze itself to the brackets and support nicely. I am wondering about the connection to the tower because there will not be grounded to the tower. There wont be any connection (metal to metal) form the satelite dish and the tower, that leads me to believe that the only grounding would be the shielded cable which gets grounded to the nice new 50" plazma.

My question is should i ground that? Should the satelite dish itself be grounded to the tower? Is there any reason for this? Safety wise or interference wise? It would be very simple to do, but not sure if I should or want to. Please give me advice as to either ground the dish to tower or not to. Does anyone think there will be issues? Should I or shouldn't I?

Thanks for any advice.

Thre can never be too much grounding when it comes to lightning.   You want to bond everything together. That way any near by discharges gets grounded and all the equipment goes up and down with the dishcharge at the same time. Voltage does not hirt the equipment ,it is just the differance in the voltages that does.

I think I would ground the dishes/coax to the tower and then atleast once more just before it comes into the house. Grounding at the bottom of the tower would also be good if the coax goes all the way to the ground.

Figures.

Several commercial tower sites I used to service used wooden
cross supports between telephone poles. The antennas were
bolted directly to the wood cross pieces.

And no, there was no grounding straps/bonds across the supports.
The only grounds the antennas saw was the "ground window" going
into the building.

Jeff

The thing with lumber is that it can hold moisture and cause the tower to
rust where the wood is.
Also if it is treated wood, the chemicals may cause the same thing only
faster.

Each cross brace has about a dozen 2" diameter galvanized stubs to
attach the antennas to. They are bolted directly to the cross braces.

All the wood was treated with Creosote just like the poles themselves.
The site was at least 40 years old the last time I was up there in 2005.

The stubs didn't look any worse than the usual stubs bolted to metal
tower assemblies.

Jeff

I think Creosote is mostly a form of oil. Probalby helps iron not to rust.

The newer treated wood needs special screws depending on the chemicals used.
Thank the EPA for that.

I'm not sure I'd want to hang a TVRO dish on one. Have you ever been on
the upper levels inside the Post Office building on Mt. Wilson?

You mean like this?
<http://802.11junk.com/jeffl/pics/Old%20Repeaters/slides/LoopMtn02.html>
<http://802.11junk.com/jeffl/pics/Old%20Repeaters/slides/LoopMtn03.html>
We had similar derrangements at 3-4 other sites. Telephone poles and lumber were about 20% of the cost of a galvanized steel tower.

Lightning protection was at the entry point to the building with a metal plate with some PolyPhasor feed through protectors. The end and highest antennas were also grounded with a undersized #4 copper wire running down the pole to a ground rod at the base. We didn't get any lightning hits because there was an all metal forestry lookout at the highest point on Santiago which took all the hits.

>The stubs didn't look any worse than the usual stubs bolted to metal
>tower assemblies.

We used the same hardware that was used the Ma Bell. Thick galvanized and loose fitting steel hardware. Same as what the typical steel tower is made from these days. It works nicely on both metal and telephone poles.

>I have a big self supporting tower in the yard, it is grounded by grounding
>rods and of course itself. I am attaching two satelite dishes to the tower.
>The most practical way is using 2x4 wood,

It won't work. The problem is that wood towers move. If the satellite dish just happens to have a very narrow beamwidth, such as with a point to point link or DBS dish, that movement is going to misalign the dish. I had a (non-paying) customer with such a derrangement. Instead of a steel pipe and concrete filled hole mounting as recommended, he installed it on top of a 20ft 4x4. I was asked to align the dish properly, which turned into a exercise in futility. The wood was still fairly green. Every time the sun shined on one side of the 4x4, it would contract on that side only. I bought a MEMS inclinometer and setup a laser pointer to measure the changes. My guess is about a 3 degree max change at the top. Note that the beamwidth of the common 24dBi 2.4Ghz dish is about 5 degrees, which means you have to be accurate to at least +/- 2.5 degrees.

>this will work great just screwing
>them to the wood and it will squeeze itself to the brackets and support
>nicely.

Using a piece of 2x4 as a yard arm will probably not produce as drastic a change. It will be somewhat less, but it will still be present. In addition, you'll have the never ending problem of securing the 2x4 properly with bolts. As the wood dries out, you'll be tightening the bolts, and re-tweaking the dish alignment.

>I am wondering about the connection to the tower because there will
>not be grounded to the tower. There wont be any connection (metal to metal)
>form the satelite dish and the tower, that leads me to believe that the only
>grounding would be the shielded cable which gets grounded to the nice new
>50" plazma.

OK, it's a DBS dish. The typical 18" pizza dish has a beam width of about 4 degrees. If it's a multiple LNB dish as used to get HDTV channels, about 3 degrees. That means you'll need to be accurate to about +/- 1.5 degrees. Wood won't work.

It will also be rather amusing to watch you try to align a dish to 1.5 degrees accuracy at the end of the 2x4. The usual method of pre-setting the elevation, and spinning the dish for max signal to get the azimuth will work only if the mounting pipe is absolutely vertical. That's not easy to do or adjust with a 2x4 hanging out away from the tower.

>My question is should i ground that?

Running a heavy copper wire up the tower and across the 2x4 might be a problem. That's because of the right angle turn at the tower. Lightning doesn't like to make right angle turns and will probably jump to the tower. I don't really know if this should be a concern.

The local DBS installers just use a #10 copper wire to the nearest earth ground. The cable guys just ground the F connector at the building entry. They're not really designed to take a lightning hit, just to bleed off any static electricity that might accumulate or to deal with an indirect hit.

>Should the satelite dish itself be
>grounded to the tower? Is there any reason for this? Safety wise or

>interference wise? It would be very simple to do, but not sure if I should
>or want to. Please give me advice as to either ground the dish to tower or
>not to. Does anyone think there will be issues? Should I or shouldn't I?

Well, if you're going to go through all that trouble to install a
proper ground, you can do as well using Unistrut instead of a 2x4.

Been on Loop Mountain too. And Oat, Lukens and Mt. Wilson.
The "tower" I was referring to specifically though was Hollywood
Hills.

The grounding inside and outside the building was your typical "Amateur"
installation. 3/4" water pipe with 90 degree elbows soldered together.

Our real protection was the water tank owned by the DWP slightly up
the hill from us. Similar to ranger tower protecting Santiago.

Yup. Works moderately well until you get some clown in the building
that runs an 8-way receive antenna and 8 bandit taxi cab repeaters.

Jeff

As the other Jeff pointed out, there's reasons to NOT use wood, but it's not because wood is bad. Purely a dimensional change problem.

Although, I suspect that the original poster is thinking of strapping a 2x4 across two legs of the tower and using just enough "arm" to get the dish to clear the tower. It may work, and it may be a nightmare trying to accurately align it.

Jeff

There were plenty of telephone pole antenna "towers" in the Hollywood Hills during the 1960's and 70's. Most are probably still there. A steel tower required an elaborate ordeal process compliments of the planning department. Telephone poles were deemed to be something akin to a tree, and were easier to permit.

During the 1960's, Ken Sessions (SK) had a GE outdoor box mounted on top of a telephone pole just below Loop Mountain. His problem wasn't lightning hits. It was hits from .22, .38, and larger. He reinforced the inside of the box with armor plate, which worked until someone

used AP ammunition. We offered him cheap space in Gene Clothier's
site on Loop, but Ken refused for some unknown reason.

>The grounding inside and outside the building was your typical "Amateur"
>installation. 3/4" water pipe with 90 degree elbows soldered together.

Lousy cross sectional area. Hopefully, they left one end open. If
the copper pipe were sealed at both ends, and it took a lightning hit,
the air inside would get rapidly very hot and probably turn the pipe
into a fragmentation bomb. If they really want to blow out the wall,
fill it with water.

>Our real protection was the water tank owned by the DWP slightly up

Bowmont water tank, off Mullholland between Laurel and Coldwater
Canyons?

Of course the end wasn't open. And there was a pair of Tee's in
the middle so it could zig zag across the ceiling. There was a
second ground pipe running around the outside of the building.

Other sites had a decent ground using #4 solid copper wire and
exothermic connectors. This, obviously, was not one of them.

I don't think so. This one was off of Cyprean Dr. Via Hollywood Blvd.
<http://g.co/maps/dw5py> 2050 CYPREAN DR. LOS ANGELES, CA

If that link works properly, you can see a nice clear picture of the
antenna rack.

K-Joy site? You must know Western Technical Services if you used to play
in Orange County. They build steel towers. If you order a mesh dish they
send an unmarked vehicle.

Never heard of them, but that was 40 years ago. We did our own antennas all of which were on wood poles. Same with everyone else on Santiago Pk in the late 1960's. Even the Air Force building used multiple short telephone poles, with one antenna per pole, a really bad idea. I worked for PMC (Pacific Mobile Comm) in Stanton CA at the time.
<http://11junk.com/jeffl/pics/Old%20Repeaters/slides/PMC02.html>

Why would they send an unmarked vehicle to install a mesh dish?

I think (not sure) that I found a recent (4/2009) photo of the PMC building on Santiago:
<http://images.summitpost.org/original/503620.jpg>
Note the large number of wooden poles and outriggers that are still in use. I was going to mumble something like "nobody mounts dishes on wood poles", but it seems that there are two in the photo. Sigh. The wood structure looks much the same as it did 40 years ago minus the wall of far too closely spaced, intermod generating, antennas.

Recent structures are all steel.
<http://images.summitpost.org/original/503619.jpg>

#4 is plenty big enough for lightning grounding. The current is high, but the duration is short. You see larger lightning conductors for mechanical reasons (e.g. where it might get damaged, or where it has to move repeatedly).

I think one can safely assume that the folks doing the experiment are
aware of all those potential error sources.

http://arxiv.org/abs/1109.4897 has most of the details

For instance:
"The distance between the target focal point and the OPERA reference
frame was precisely measured in 2010 following a dedicated geodesy
campaign."

the distance is 730534.61 +/- 0.20 meters, by the way.

"The high-accuracy time-transfer GPS receiver allows to continuously
monitor tiny movements of the Earth�s crust, such as continental drift
that shows up as a smooth variation of less than 1 cm/year, and the
detection of slightly larger effects due to earthquakes. The April
2009 earthquake in the region of LNGS, in particular, produced a sudden
displacement of about 7 cm, as seen in Fig. 7. All mentioned effects are
within the accuracy of the baseline determination. Tidal effects are
negligible as well."

The odds are distinctly against that being true.

At the end of the day, the measurement is going to expose a design
flaw (recall the Hubble Lens?), not shake the foundations of Physics.

One of the neighboring towers took a direct hit.  The #6 AWG he was
using literally exploded, spraying melted copper everywhere and
blowing pieces of concrete block all over the building.

<http://en.wikipedia.org/wiki/American_wire_gauge#Table_of_AWG_wire_sizes>
Fusing current (32msec) for #4 is 34,000 Amps.  The average lightning
hit is about 20,000A but can go up to 200,000A.
<http://www.lightningsafety.com/nlsi_info/media.html>
Other references offer averages from 5,000 to 50,000A.  I would call
#4 marginal but probably adequate for California, which doesn't get
much lightning.

Unistrut is wonderful. About 20 years ago, I used to engineer installations
in a big government lab in San Diego and it was the customer's preferred
method for anything structural that didn't involve concrete. :-)

I learned you could do anything with Unistrut. It's the Erector Set / Lego
Blocks for grown-up kids.

Agreed. However, you have to be careful using Unistrut for outriggers on towers. Unistrut doesn't do well when twisted (in torsion) by a top heavy antenna. The only way that seems to work well on a tower are two 1 1/2" channel Unistrut outriggers, with a connecting pipe for mounting the antenna, dish, or whatever. A single outrigger usually results in a the antenna twisting around in the wind. (1 1/4" will work with light antennas).

Something like this:

Thanks for all the info

I am going to ground out the satellite dish to the tower.

Now it is grounded to my new plazma and I would feel more comfortable with it grounded to the tower. Don't want nothing happening to that new plazma.

Now of course if it ever got hit by lightning I would imagine the receiver would get fried, maybe not the tv, the coax goes into the receiver, then into the yamaha sourround sound then into the tv. A jolt has to stop somewhere along that line.

I know what an opto-isolator is. (Provides a signal path with a short-range modulated light beam -- no copper connection) I don't know if any have been designed/sold for lightning protection.

Anybody?

One might want to check a different source for fusing current. The standard test lightning stroke has a 2 microsecond rise time (10% to 90%) and a 50 microsecond fall time (to 50%) typically represented by a double exponential (1-exp(-t/a))*exp(-t/b), so when you used the Onderdonk equation, you want to use a 50 microsecond pulse

In general, fusing goes as a function of the "action", I^2*time.

The equation from Onderdonk is usually used for this kind of thing (as shown in the table you cited). Onderdonk's equation assumes a rectangular current pulse, but that works for the most part and for lightning, it would be a conservative estimate.

For a 50 microsecond pulse, the fusing current is 22 amps/cmil (vs .87 A/cmil for the 32 ms pulse)

AWG4 is 42kcmil, roughly, so the fusing current is well over 8000kA

Another approach to analysis might be to consider the energy dissipated in that wire. It's a bit tricky, because as the wire heats up, the resistance increases. (by a factor of 4 or 5 at the melting point, as I recall)

But let's consider a meter of that wire which is 5.189mm in diameter. it has a resistance of 0.82 milliohm (at 25C). Let's round up to 5 milliohms.

Let's say our lightning stroke has an RMS current of 50kA (peak current would be higher), so we have (50E3)^2*5E-3 = 12.5 MW. But that lasts for only 50E-6 seconds, so we deposit 12.5E6*50E-6 = 625 Joules into the meter of wire.

That wire has 21 sq mm cross section so the one meter length is about 21E-6 cubic meters or 21 cc. Copper has density about 7 g/cc, so we've got around 150 grams of copper there. At a specific heat of 0.385 J/g every 58 Joules will raise the temperature 1 degree. Since we're dumping in about 600 joules, that lightning stroke will raise the temperature around 10 degrees.

In practice, a typical lightning strike has several strokes, so you probably dump 4-6 times that amount of energy into the wire. But still, you're talking maybe a 50-60 C temperature rise, which is LONG way from the 1000 degree rise you need to melt the copper.

Your observation of total destruction of a copper conductor was probably from some other mechanism. The electromagnetic forces are the best candidate. I used to do some quarter shrinking, and a few thousand amps in sub millisecond pulse would destroy a AWG10 coil from the magnetic forces.

An unsupported turn of AWG 4 or 6 wire would probably be destroyed by a 20kA pulse with a rise time of 2 microseconds. The di/dt is 400E9 A/sec, so the flux is pretty spectacular.

The other source of disaster in high power pulse discharges is if there is a loose connection or a gap in the conductor. The several tens of volt cathode drop in an arc at 20kA gets the peak power up pretty high, and unlike in the example above where the 12MW is distributed over a meter of length, you get that megawatt dissipated in a few cm, so the energy density is much higher.

Typical optos can stand off 5kV or so. Speed is a problem  There are off
the shelf opto isolator widgets for things like RS232 and phone lines
that are fairly inexpensive.  Get to RF, though, and the price goes way up.

If you need more, you go to a fiber optic link of some sort.

Almost certainly you're right.  But as far as the error sources
referenced in the older post (solid earth tides, etc.):  those have been
taken into account.

>Thanks for all the info

Y'er welcome. Now, if you want a usable answer to your question, it might be helpful if you describe the tower, what manner of DBS dish, and some of the distances involved.

>I am going to ground out the satellite dish to the tower.

If your unspecified type of tower is properly grounded, the tower will protect the dish from a direct hit. Still, it's a good idea to ground everything to reduce the effects of induced currents from a nearby hit.

Grounding the dish is probably a good idea. Grounding the LNB at the dish is a bad idea. Depending on model of LNB, many of them have no DC connection between the LNB case and the dish ground. This is not for lightning protection but to prevent ground loops. In general, you want to do it the way the installation manual suggests and the NEC electrical code demands, which is a grounded barrel connector somewhere close to the utilities ground.
<http://www.dbsinstall.com/whatis/Whatisgood-5.asp>
Such a ground is NOT to protect against lightning, but to protect against getting electrocuted if the satellite receiver magically loses its protective AC ground and leaks some 117VAC onto the coax.

This discussion has some good comments on DBS dish grounding.

<http://www.dbstalk.com/showthread.php?t=16300>

>Now it is grounded to my new plazma and I would feel more comfortable with
>it grounded to the tower. Don't want nothing happening to that new plazma.

>somewhere along that line.

The general idea is to give the current a better path to ground than through your expensive electronics.

Incidentally, I just found this on using wood for mounting:
<http://www.dbsinstall.com/diy/GroundPostInstallation.asp>

What's inside a Polyphaser cellular lightning protector:
<http://802.11junk.com/jeffl/pics/lightning/index.html>
Note the 4 ceramic spark gaps in series. You get 4 hits, and then it shorts out.

Same here Jeff, creosote poles and cross arms 30 years old with hot
dipped galvanized hardware. No sign of deterioration.

Jimmie

Recently acquired an LDG tuner. Nice part.
I'm looking forward to the not having to twist knobs every
time I change frequency.
It comes with an adapter cable for Icom radios, but it's a
4-pin Molex connector and the manual doesn't show what the
connections/signals are for the radio.
Anyone out there connect this tuner to an IC-761 already?

Thanks
Jeff-1.0

Buy or clone the LDG Icom interface cable. The IC-761 supports the
Icom AH-4 antenna tuna, so it should work:

Schematic:
<http://www.ldgelectronics.com/assets/images/products/cables/IC%20cable.jpg>
Alternate source:
<http://www.cheapham.com/products/LDG-IC%252dPAC%252d6-Icom-Interface-Cable-
%252d-6-Foot.html>

Hmmm... why do you need an antenna tuner?  Can't you build an antenna
that's close to 50 ohms?  Or, are you like me and just hang any random
length of wire in the trees and hope for the best?

For close to 40 years I bought into the myth of 50 ohm antennas.
Absolute crap results. (Well, I've always had very good luck with
a dipole for one band.)

Earlier this year I put up a 102' doublet fed with open wire line
and have been working the entire planet with less than 100 watts.

But you're right, I'm a lazy bastard and would like the frequency
agility rather than having to tweak the knobs on the MFJ tuner
every time I change frequency.

Mythology went out with the Greeks and the Romans. Modern antenna design requires newer beliefs and religions. Apparently, your practices within the Cult of 50 ohms has failed to bring about the desired miraculous DX. You might want to petition the radio gods for a review of your design before you discard the cult completely. However, there are alternative religions.

In my case, I switched and am now a practicing member of the Cult of 75 ohms. The difference is subtle. While worship of the 50 ohm idol results in the maximum power transfer, the change to 75 ohms results in minimum coax loss and somewhat easier antenna design. However, the major benefit is it allows one to minimize the tithe paid to vendors as CATV coax is cheap and readily available. I suggest you consider a religious conversion.

>Earlier this year I put up a 102' doublet fed with open wire line
>and have been working the entire planet with less than 100 watts.

Hmmm... perhaps that's because the bands were miserable all last year and have only recently begun to show signs of life. Timing is everything.

I thought you were trying to load a barbed wire fence. I'm dissapointed.

>But you're right,

Far right, please.

>I'm a lazy bastard and would like the frequency
>agility rather than having to tweak the knobs on the MFJ tuner
>every time I change frequency.

Yeah, I know the problem. Every time the kite at the end of your 102ft doublet looses altitude, and the middle scrapes ground, you have to retune. However, the IC-761 has plenty of knobs and switches to play with. I don't see how a few more on the tuner could make any difference.

>Jeff-1.0

I think your question relates to the connections between the LDG and that Molex plug.

Was it LDG who supplied the adapter? If so, ask them. Seems a bit silly that would supply the thing without adequate information on how to use it.

Well, I did ask LDG and they were kind enough to send me the application note describing the connections.

And the more I looked into this the more I realized, "You have an antenna tuner built in into the Icom IC-761."

Homer Simpson moment, "Do-oh!"

However, the specified tuning range of the internal tuner is 16.7 to 150 ohms. The LDG is specified as 6 to 1000 ohms. A bit more latitude.

OK, "How did I get side tracked like this?"

Earlier this year I got an MFJ Versa Tuner to use with the doublet antenna. It works fine. But of course, it's manual. (But it does have a 4:1 balun inside.) So I get the LDG in a swap for some goodies. No balun inside. Ok, I ordered an MFJ 4:1 current balun. And those do work a LOT smoother tuning that with the internal 4:1 voltage type the MFJ tuner has.

It was while obsessing over the "talk to the radio" cable for the LDG that I realized, "Oh right, this is designed for radios that don't have internal tuners." For example, my Icom IC-726 has the correct interface to talk to the LDG. I do have the matching AT-150 auto-tuner for the IC-726. That is specified the same as the IC-761 tuner.

Once the balun gets here, the FIRST thing I'm going to do is to find out if the internal tuner has enough range to deal with my antenna.

I just love wild goose chases, because in the end, you usually do
learn something useful in the process.

Well, I've come to a few conclusions.
1. Dipoles with a 1:1 balun work very well.
2. See #1. However, the trees and other things they are attached to are hard to rotate.
3. Vertical antennas load nicely. So do Bird Termalines. And they radiate about the same.
4. See #3. If I had room for a bunch of radials to make the vertical work properly, I'd have room for a real antenna.
5. Yagis do nicely. _IF_ you have the tower and rotor to put them on.
6. A 102' doublet with open wire feed line and a tuner works amazing well and considering the cost difference is flat out outstanding.

Re: #4. Having moved to a small rural town in central Texas, I have a lot of room now living on 1/2 an acre.

I already had a used 40' tower and was given the tuner as a bribe to try the 102' doublet. And I had a 500' spool of #14 THHN house wire to play with.

Isn't half the fun of all this seeing what works well for you?

Yes, there is always a risk of that.

The auto tuner can be a path to hiding shortcomings in an antenna system, in search of the holy grail, low VSWR.

Whilst you seem critical of the 4:1 voltage balun in the MFJ, it is my perception that they are still the most popular balun. My theory on that is that antenna systems that exhibit extreme impedance can often be 'matched' with that configuration, assisted by the loss in the balun.

It is an example of how the device's operation can be misunderstood. There is little doubting the considerable anecdotal evidence that 4:1 voltage baluns work 'better', it is understanding what is meant by 'better' that is revealing.

That leads into the question of whether a 4:1 balun is 'better'.

If you were selling product, you would concentrate on the things that deliver good VSWR, because that is all that is in the minds of most buyers.

Owen

PS: for avoidance of doubt, nothing above should be interpreted to recommend a 4:1 voltage balun or a 4:1 balun.

This is a 102' doublet with 40' of open wire balanced feed line.
Except for the input of the tuner looking like 50 ohms to make the
transmitter happy, there is no such thing as "low VSWR" on this
type of antenna.

Actually, the MFJ 949b Versa Tuner has an internal 4:1 voltage balun.
The reason for that is simple. One large toroid and you're done. There
isn't room inside the case for a 4:1 current balun.

If you disconnect the open wire line from the internal voltage balun
in an MFJ tuner and replace it with an external current balun you will
find that the tuning of the match on the tuner is a lot smoother as
opposed to almost erratic. (But still obtainable.)

Due to the location of my station on the 2nd floor over looking a
covered porch, having a "good RF ground" is not going to happen.
The current balun forces the antenna and feed line into a truly
balanced condition. No ground needed, other than a proper bonding

of all the related equipment to a common reference in the station.

The whole purpose of the tuner is to allow the transmitter to see a 50 ohm unbalanced load that it was designed for. Accomplishing that, allows the most power to be transferred to the antenna. The 102' doublet with open wire line seems to do a remarkable job at radiating. (And equally well at receiving.)

> That leads into the question of whether a 4:1 balun is 'better'.

Better than what? A 1:1 balun or none at all, which seems to be the selling point of the G5RV antenna and it's clones.

Well to "make the transmitter happy" is jsut the new language for low
VSWR.

> ... There
> isn't room inside the case for a 4:1 current balun.

But there is probably room for an effective 1:1 Current Balun.

Ok, so in your experience, you haven't yet come across a load that could
be matched with the voltage balun, but not with an external current
balun.

> Due to the location of my station on the 2nd floor over looking a
> covered porch, having a "good RF ground" is not going to happen.

Ideal conditions like "forces" and "truly balanced" don't often exist in
the real world. It would be of more interest if you had measured and
reported the differential and common mode current at various
frequencies.

> The whole purpose of the tuner is to allow the transmitter to see
> a 50 ohm unbalanced load that it was designed for. Accomplishing
> that, allows the most power to be transferred to the antenna. The

Yes. It is the meaning of "most" that is relevant. Most doesn't need to
mean 100%, or close to it, you make compromises for frequency agility
and multiband use, but "most" is often unknown. Perhaps some DX QSL
cards can substitute.

> 102' doublet with open wire line seems to do a remarkable job at
> radiating. (And equally well at receiving.)

Yes, they can be a good antenna, but it is not a no-brainer.

For example, a correspondent recently reported problems with just such a thing on 40m. Turns out his feed line length was such that at 800W into the feed line, the voltage between the wires was some 4000+V and was causing flashovers in a 3kW rated ATU. In this case, I recommended that since he could not lengthen or shorten the feed line enough, that he shorten the antenna so solve the problem.

He had previously smoked up a CWS Bytemark 5kW rated current balun on 80m with another antenna, caused by unlucky feed line length.

>
> > That leads into the question of whether a 4:1 balun is 'better'.
>
> Better than what? A 1:1 balun or none at all,

1:1.

4:1 reduces the voltage impressed on the ATU components, which is good for high impedance loads, and poor for low impedance loads.

There is no simple thing that always works best on a random set of loads (which is the case for many multi band antennas).

> which seems to be
> the selling point of the G5RV antenna and it's clones.

Perhaps to some. There is good argument for use of a balun with a G5RV and not-balanced transmitter. Varney conceded that in one of his later articles. Most people who are adament about what Varney did or did not describe have not read his articles. Antenna manufacturers are not a good source of factual information.

Owen

You're missing the point. The "Holy Grail" is low VSWR at the antenna.
Obviously having the tuner present a nice resistive 50 ohm load to a
transmitter designed to be loaded with a resistive 50 ohm load is a
"Good thing(tm)".

But with a random length, i.e. non-resonant, antenna, VSWR at the
antenna is not a meaningful term.

>> ... There
>> isn't room inside the case for a 4:1 current balun.

But my point was MFJ chose to use a voltage balun for two reasons.
They're cheaper and they still work to a fashion.

> Ok, so in your experience, you haven't yet come across a load that could
> be matched with the voltage balun, but not with an external current

Not yet. If it matches at all with one, it will match with the other.

The difference being that the current balun results in much less erratic/sudden/critical tuning of the antenna tuner itself.

Um, actually, yes they do. That's the whole point of a current mode balun.

As an example then. How about working RA3DA in a pileup competing with the "big guns" in New York running at or above the legal limit? Sure I didn't get him on the first call, but I did it running under 100 watts and into a $25 antenna.

See above. Why is it that hams seem to think they absolutely need to run 800 (or more) watts of power?

You're hear equally unsubstantiated claims about how well an off center
fed Windom antenna works with no tuner as well.

Yes. Somebody in this group (you, maybe) previously promoted 75 ohm cable.
This past spring, I was modeling my 20m Field Day dipole, varying size and
height for best pattern shape and minimum VSWR. At optimum, it had almost
exactly 75 ohm feedpoint impedance. Having plenty of TV coax, I didn't
hesitate to go with it. The antenna worked wonderfully well at FD.
Transmitter seemed to like it just fine.

Sal, you will have discovered that the feed point impedance of a half wave dipole at resonance is dependent on height above ground, type of soil etc.

This need not be a choice between 50 ohms and 75 ohms.

My 40m inverted V dipole uses 75 ohm feedline (RG6), and the impedance looking into the feedline is close to 50+j0. Dipole height was determined prior to design of the matching system (ie height was not constrained by the matching solution, rather the height set a requirement for the matching solution). The transmitter has its rated load impedance, the feedline is efficient and inexpensive. There is a W2DU style choke balun near the feedpoint, and measured common mode current is quite low.

Of course, the feedline has standing waves, and the dipole is not resonant, to be frowned upon by some (many?). The antenna system can be readily modelled, and it has higher efficiency than a resonant half wave with comparable coax (say RG8X), indistinguisable pattern, marginally higher gain.

Owen

Probably me. I tend to promote the use of 75 ohm coax and systems.
Most of the coax cables to my rooftop antenna farm are 75 ohms. The
justification was convenience and price. I obtained five 1000ft rolls
of RG6a/u mutations (some with messenger wire), and some used hard
line, and couldn't resist using it. The only problems seem to be
getting accurate readings on my test equipment and having enough
F-to-N or F-to-BNC adapters.
<http://www.qsl.net/n9zia/wireless/75_ohm_hardline.html>

Note that using 75 ohm coax on a VHF/UHF repeater is a really bad
idea. Duplexers, isolators, circulators, cavities, and such are very
sensitive to mismatch. For repeaters, use only 50 ohms.

I have an MFJ-928 ATU at the feed point of an elevated 43' vertical, with
a half dozen radials of various random lengths. It works great for
30/20/17/15. It starts making significant multiple lobes above 21 MHz.
I'm going to try a coil for 80.

What is the price differential in winding one wire outside the core,
instead of winding it inside the core? Such "savings" accrue only in
the production run of millions of units.

>and they still work to a fashion.

If both sides are unbalanced - you mean that fashion?

MFJ is not making a killing on this particular poor winding (OK, call
it historical inertia) practice, and their market for these internal
BalUns is dipoles, not monopoles.

Some fancy bookkeeping could balance the accounts, I suppose.

I still would smile at the dis-connect of logic, however.  And I would
suppose the next step is the rehabilitation of the term Relativity
insofar as Physics.  Would we storm the libraries with label makers to
white wash the term out?  What would that science be called?
     Post-Newtonian Physics?
     Pre-Neutrinian Physics?
     Informally, both?

I see a generation of Physicist candidates struggling through years of
lectures trying to distinguish between the two being uttered from the
podium.

I need to find the internal ram board for an Icom 745/751.  I broke
mine by pushing too hard when reinstalling.

Money is tight, as we all know.  Do you have one that I can buy?

I sure would appreciate it.

Thank you.

> MFJ is not making a killing on this particular poor winding (OK, call it historical inertia) practice, and their market for these internal BalUns is dipoles, not monopoles.

Hi Richard,

I see MFJ getting mention, and whilst they may deserve a bit of a flogging for some things, I spring to their defence on this occasion.

MFJ make the claim "More hams use MFJ-949s than any other antenna tuner in the world!" and gauging from questions in online fora, they are indeed popular, the claim may be correct.

The MFJ949E uses a Ruthroff voltage balun.

I have measured the balun losses in my '949E, and they are as I discussed in the general case earlier, quite high on high impedance loads. Anyone with a rudimentary knowledge of balun design would understand that, but there are those who apparently live in an ideal who would refute it.

The simple explanation is that most loss in practical ferrite cored baluns usually results from losses in the core material. The losses in the core material are related to flux density, which in a Ruthroff voltage balun is roughly proportion to the differential voltage, and in a Guanella current balun is roughly proportional to common mode current. There is no reason to think that these two different types of baluns would have identical losses.

The MFJ949E could easily be reconfigured as a Guanella 1:1 balun by changing its end connections, but that does not make it an optimally designed current balun. I haven't done it, and so cannot comment further. I cannot see how the cost of manufacturing it wired as a current balun would be any different.

I think that it is the buyers who determine the market, and savvy sellers cater to the buyer's wants.

While anecdotal evidence abounds that 4:1 voltage baluns match up extreme loads better, and users mostly arent't interested in finding the root cause of the problem and fixing it, voltage baluns will be seen by most buyers and savvy sellers as the solution.

A good demonstration of the credibility of anecodotal evidence is the massive online support for the Array Solutions 4:1 Ruthroff voltage balun / ZeroFive unloaded vertical combination. The configuration drives high common mode on the coax feed line. (I should note that the sellers recommendation has recently changed to an unun.)

MFJ is no doubt one of the savvy sellers. They do BTW have some higher end ATUs with 1:1 current balun, as does the Ameritron label for those who want a current balun.

My own view is that achievement of highest choking impedance in a current balun is assisted by minimising stray capacitance to 'ground', so I would prefer to put a current balun in a non-conductive box, outside the ATU, on a foot of coax to the ATU. (This is one reason why I haven't tried converting my '949E to current balun connection, the windings are quite close to grounded metal and I expect stray capacitance to ground is higher than desirable.)

Owen

Hi Owen,

The internal modification would also demand a balanced tuner topology,
and not the garden variety pi configuration. Your stating stray
capacitance, coupling to ground, etc. is a preface to this.

Put simply, and as described, the 949E and its ilk are lumped
transmission line UnUn transformers.  You might salvage the box in a
re-design, but it would require gutting the entire interior circuitry.

The 974 attempts to do this:
http://www.mfjenterprises.com/pdffiles/MFJ-974HB.pdf
and by their stated intentions, they are aware of the design issues.

I am sceptical of the "true balanced tuner" approach.

For one thing, I do not recall having ever seen measurement of the common mode impedance reported.

If the objective is current balance, high common mode impedance is essential.

Some folk seem to think that symmetric design is the sure path to success, but it isn't. If you take a 1:1 Guanella with extremely high choking impedance, the currents in its output wires will be almost perfectly balanced, irrespective of the voltage from each terminal to ground. If you placed 10pF of capacitance from each terminal to ground, you appear to have preserved symmetry, but the currents in those capacitors will not be equal unless the load is symmetric. In cases where the currents in the balun wires are almost equal and the currents in the capacitances I mentioned are not equal, then those capacitances have probably compromised common mode impedance.

Most implementations of a "true balanced tuner" have large stray capacitance from each side to chassis.

But, savvy sellers will offer them to the people who are attracted by the concept of a "true balanced tuner".

The joke of balun offerings is those designs purported to work well on isolated loads. If the concept of the load is the overly simplistic two terminal network, and it is isolated from ground, clearly current into one terminal MUST equal current out of the other terminal, no balun is required.

I have Linux on an old machine (P3, 1 GHz, 256M RAM) that really doesn't do
it justice. I was impressed that it recognized almost every USB device I
plugged in, new or old. I really should get a newer machine and load it up
with Ubuntu.

Multiple Homer Simpson "Do-oh!" moments.

LDG was kind enough to supply me with the application note for the interface cable.

I have two Icom radios. An IC-761 with an internal tuner and an IC-726 designed to use with an external tuner. The IC-726 has the mating 4-pin Molex connector.

The two signals are essentially a "request to tune" and an "tune complete". The IC-726 has a TUNE button on the front panel for telling the external tuner to do it's thing. (By the way, I do have the matching AT-150 auto-tuner for the IC-726.)

All three of the tuners, the IC-761 internal, IC-726 external and LDG have an SO-239 connector for the output and would require an external balun to connect to an open wire balanced feed line.

The reason I was using the MFJ Versa Tuner with the IC-761 was fairly simple. It has an internal 4:1 balun and connections for open wire balanced feed lines.

Since I had to purchase a balun to use the LDG tuner I realized that "Oh, I can use the Icom tuners with the balun as well."
That was my first "Do-oh!" moment.

Subsequently on researching the interface signals to/from the LDG I realized that the IC-761 doesn't have a TUNE button or the signals externally because the tuner is already inside the radio.
That was my second "Do-oh!" moment.

Once the MFJ 4:1 current balun I ordered arrives, the only question that remains is whether or not the specified matching range of the Icom tuners is sufficient to deal with my antenna system.

The Icom tuners are specified at 16.7 to 150 ohms.
The LDG Z11 Pro II is specified as 2-1000 ohms.
Oddly enough, the MFJ Versa Tuner has no specified range.

That is not quite correct.

Though the protocol is not published by Icom, and the implementation varies a little from radio to radio, the four wires are usually labelled and none are "tune complete".

Hi Antonio,

Then, it would appear, after your having discarded technical points curiously you want to be validated for thinking your antenna is lossy.

It will be hard to do that without your evidence (back of the envelope computation does not qualify) that is contrary to everyone's experience.

>Not so much full duplex, but single frequency half duplex, with
>negligible time delay (implying <100ms frame time) between Rx and Tx.

Most of the delay will not come from the flight time or mux switching. It will come from the necessary audio compression. It won't work without audio compression, which means that some types of uncompressible pre-randomized data is not going to work (no big deal). Also, the more compression, the longer the latency.

>TDMA cellphone uses split bands probably because it was on top of
>existing AMPS systems.

Yep. The problem was that TDMA (IS-54/IS-136) had to be compatible with the then existing analog cell systems. Therefore, all early TDMA phones had to offer analog compatibility. Digital only phones weren't available until about 2003.

There's also little justification for making the change. It will not double the number of available channels as some pundits have suggested. Since the return audio now has to be sqeezed into the previously transmit only channel, the number of users per channel is cut in half. The result is no capacity change.

>There is also a frequency allocation issue (e.g.
>no need for new licensing). Having separate forward and reverse bands
>also helps with frequency reuse and near-far issues. I hardly think
>that hams are going to carpet the country with repeaters to the extent
>that cell sites do.

I've looked into butchering cellular handsets into something usable on ham radio. I have internals on some of the old Motorola flip phones and bag phones and could probably modify the firmware sufficiently to turn it into a conventional radios. The fatal flaw was the fixed 45MHz T/R offset. There were simply too many components that would need to be replaced in order to operate on the smaller offset available to hams, or on simplex. In addition, it's usually fairly easy to go down in frequency, but the phones would require going up from the 850MHz cellular bands to the 915MHz ham band. I gave up on the idea.

Yep. The problem was that GSM had a built in distance limit at about 35 km. Any furthur and the timing would get mangled. That was changed with adaptive timing:
<http://en.wikipedia.org/wiki/Timing_advance>

Codecs are incredibly important. A 1% increase in channel capacity translates to adding thousands of additional users to a system. Nobody uses fixed rate codecs these daze. The current fashion is variable bandwidth schemes, such as EVRC, SMV, 4GV, etc (for CDMA). The challenge is to get something that sounds decent with low latency, but doesn't blow up with weak signals, high error rates, lousy SNR, etc. When someone succeeds, it's immediately patented, creating the predicable licensing mess.

Drivel: I once worked on a codec that required the receiving end to have a library of the speakers phoneme sounds in storage. That drastically reduced the amound of information that needed to be sent. It would have worked and possibly sold, except that it was far too easy to impersonate someone by simply switching phoneme libraries. It was a fun project while it lasted.

On 9/9/2011 12:10 PM, Antonio Vernucci wrote:

> For 75 and 80 meters, I use a shunt-fed tower (58 feet high, with a fairly big HF yagi on its top). The home-made tuner, placed at the tower base, has a motorized variable vacuum capacitor in series and a (properly selected) fixed capacitor in parallel. I can so remotely tune the variable capacitor across the 3500 - 3800 kHz range obtaining a perfect match to 50-ohm everywhere in the band. The antenna works fine and I receive good reports.
>
> The only thing which worries me a bit is the very high voltage that develops at the antenna end (about 6,900 Vrms at 3.500 MHz with 2kW applied, growing to about 8,600 Vrms at 3.800 MHz). I am not sure whether such high voltage could be a source of significant losses.

Generally, your losses are going to be IR losses. High voltage implies low current, and low loss.

However, when you start talking kilovolts, you might have significant loss from corona discharge.

>
> To solve my doubt, I started by precisely measuring the capacitance of the tuner capacitors, and I could then easily calculate the antenna impedance at 3.500 MHz, which resulted to be (18.2 + j 656) ohm.
>

That's the feed point Z of the basic radiator? or of the whole assembly, including the shunt feed wire/tube?

> ABOUT CURRENT
> With 2 kW applied, one can easily determine that the RF current flowing through the antenna is about 10.5A, quite higher than the 6.3A figure one would get should the antenna resistance be 50 ohm instead of 18.2 ohm. So, I must expect some more loss in the conductors due to the fairly high current.

Yes, that seems reasonable, but what conductor is that 10 amps flowing in? What is its AC resistance at 3 MHz?

>
> ABOUT VOLTAGE
> The 10.5 A current flowing through the big 656 ohm antenna reactance causes the antenna RF voltage to get up to 6,900 Vrms at 3.500 MHz. Touching the wire with a (well insulated) screwdriver, you would see a nice Tesla-like arc. I am wondering whether such a high voltage could constitute, by itself, a source of extra loss. Please note that the wire coming down from the tower is connected directly to the vacuum capacitor terminal, with no stand-off insulator. So, I do not see a place where power can get dissipated due to the high RFvoltage, other than perhaps in the humid air (?).

Corona is definitely a source of loss. Humidity doesn't change corona much, but does change leakage across insulators (i.e. the crackling one hears under HV power lines on damp mornings).

However, is it a *significant* source of loss? How much stuff is at the HV? What's the actual surface field? (Running a screwdriver near it perturbs the field)

>
> I could probably avoid this situation by changing the tap height on the tower, but I would run the risk of not being any longer able to tune across the whole 3500 - 3800 kHz band adjusting one of the two capacitors, and not both.
>
> Any idea on whether the high RF voltage present on the antenna could cause some significant loss?

HV loss is hard to estimate. You could make your shunt wire a shunt tube or rod and basically eliminate corona (A rule of thumb is that 10-15 kV/cm radius will have virtually no corona.. so for your 6kV, a 1cm diameter tube is in the right ballpark) Skin depth at 3.5 MHz in Aluminum is .043mm, and the usual rule of thumb is to make the tubing wall thickness 3-5 skin depths. 0.12-0.20 mm seems about right. Copper could be thinner wall (skin depth is less)

I'd worry more about loss across dirty insulators.
And even more about IR losses.

Hello Tony,

It is not the voltage that will introduce loss (as the field lines will go into air and frequency is low), but it is (corona) discharge. Whether this occurs, depends on presence of sharp edges and especially sharp (double curved) surfaces with small radius, think of bolts, threaded rods, etc that point away from the tower into the air.

A thin end of an antenne element can also cause breakdown as it points far into the air (away from other solid structures) and the voltage maximum will be at the elements of your HF antenna.

In case of your > 8 kVrms (that is 12 kVp), an antenna element with 10mm diameter and spherical (smooth) end may result in 2.4kVp/mm at the end. If the end of the element is just straight (just cut aluminium), you will exceed 3kVp/mm and corona will occur.

If (corona) discharge occurs, you will notice a sudden change in VSWR with increasing power.

I presume that the corona effect should be visible at dark. So far I have seen none, but we had not a single day of rain since I mounted this antenna (incredible summer season...). So, I must verify when rain will come, in a few days from now they say. Or do you think that corona may not be visible?

I am using a 4-mm diameter wire so, if I will really have corona problems, I could insert the (vertical) wire into a 1-cm aluminum tube connected at the very bottom of the wire (i.e. at the antenna feed point). Probably a 2-meter long tube could be sufficient (RF voltage gradually diminishes getting away from the antenna feed point).

Hi Wim,

despite my wire is only 4mm in diameter, SWR does not vary at all applying a steady full-power carrier (not even some small oscillations of the reflected power meter needle). I then presume that no big corona effect takes place (also because I see no corona light at dark). I am not sure whether a light corona effect (i.e neither visible nor influencing SWR) could take place, but if so I presume loss would anyway be very low.

I will check again under rain conditions (test not done so far), but I am not sure whether rain increases susceptibility to corona, with respect to hot summer days (with umidity close to 80% sometimes). Any idea at that regard?

73

Tony I0JX

> Hello Tony,
>
> It is not the voltage that will introduce loss (as the field lines will go into air and frequency is low), but it is (corona) discharge. Whether this occurs, depends on presence of sharp edges and especially sharp (double curved) surfaces with small radius, think of bolts, threaded rods, etc that point away from the tower into the air.
>
> A thin end of an antenne element can also cause breakdown as it points far into the air (away from other solid structures) and the voltage maximum will be at the elements of your HF antenna.
>
> In case of your > 8 kVrms (that is 12 kVp), an antenna element with 10mm diameter and spherical (smooth) end may result in 2.4kVp/mm at the end. If the end of the element is just straight (just cut aluminium), you will exceed 3kVp/mm and corona will occur.

What happens if you move the slant-wire up or down on the tower?

I would  think the losses as a result of 10 amperes current at the
feed point not to be excessive unless your shunt feed is made of small
wire. This is usually not the case if only designed for sound
mechanical integrity.

Oddly, I have been looking for a simple streaming audio app (to bring
back audio from remote receivers via 802.11 for a antenna measurement
project)...  This one is clearly not it, but what else is out there.

Nope.. you can't usually see the corona discharge. The professionals
use a special camera with a narrow band solar blind filter.

Please forgive me but it seems a little odd that someone who can make
the calculations you have made can not compute the IR losses in the
feed. You are almost there.

Jimmie

Hello, all. I came across an article in one of my science mags in which some researchers had discovered a method to coax more bandwidth out of a given portion of the EM spectrum by "twisting" radio waves together. Nothing more technical than that in the article. Well, I managed to find one the author's papers on the subject online:

http://arxiv.org/pdf/1107.2348v2

If this technique is viable, I'm wondering why it is only now being contemplated. Note the "twisted parabolic antenna" (Fig. 3A) on p.16.
Of course this makes me want to do some experiments in the ham bands.
(I hope this doesn't turn out to be another CFA-like pursuit).
Sincerely, and 73s from N4GGO,

```

Hi Jimmie,

I am not sure of what you mean to say.

With regard to the IR loss (by the way, I presume that "IR" means I squared times R), there is little difficulty to estimate them once you know the RF current.

But my point was to estimate any extra losses caused by the very high voltage that develops at the antenna terminal. I would not know how to estimate those.

73

Tony I0JX

Please forgive me but it seems a little odd that someone who can make the calculations you have made can not compute the IR losses in the feed. You are almost there.

Jimmie

Jimmie

That is interesting.

But I presume that, increasing voltage, at a certain point the corona effect becomes visible.

Skype. It's commonly used to deliver the audio portion of HRD (Ham
Radio Deluxe). Install the remote end with your favorite operating
system and set Skype to auto-answer any incoming calls from your

account. As soon as you connect, you get audio, with fairly low latency.

If you want to roll your own, there's:
<http://www.speakfreely.org>

There's also:
<http://umediaserver.net/umediaserver/download.html>
There are plenty of other streaming audio apps available. However, be careful as many of them are designed for streaming music or video, and therefore have enormous latency. I vaguely recall my adventure with Microsloth Media Encoder 9 and it's 45 second delay.

If you want multiple channels of audio, better bandwidth, or have some exotic requirements, you'll need to supply more detail.

Hello Tony,

As long as your wire with D=4mm is not close to other structures (say 0.25...0.5m), you will not exceed 1 kVp/mm when the wire itself is carrying 12kVp. You still have some margin before getting close to 3 kV/mm.

At ground level, influence of HF frequency on dielectric breakdown voltage of air is negligible. If the wire is coated, the diameter increases, hence reducing the E-field at the plastic-air interface.

When VSWR doesn't, change (with increasing power), the loss due to corona discharge will be minimal. Of course when you lose 10W from 2kW, you will not notice this probably. However if you get a discharge between metal and plastic insulation, the plastic will fail in the end (due to spark erosion).

conducting Droplets (rain) do reduce the breakdown voltage as it distorts the field. This introduces 'hot spots'. Unfortunately I don't have data on this.

I could imagine that moisture/water layer on the wire would introduces some loss (as you get a current through the moisture layer). But this is not due to corona effect.

It can be calculated, as you know the voltage and you can calculate the capacitance to ground (so you know the capacitive current that "leaves" the wire.

I personally know one of the most committed researcher working on the twisted waves.

No doubt on the theoretical background, but significant doubts about practical applications of that technique (but that is just my opinion).

From what I know the experiment they carried out in Venice last May was not engineered in a such a way to permit confirming times-4 multiplication of the radio link capacity (times-2 due to the use of orthogonal polarizations, and another times-2 due to the twisted waves), see
http://lighthouseinthesky.blogspot.com/2011/07/radio-vortices.html

Thanks for info. When things go down to the physics level, it is not so easy to understand phaenomena, unless one has specific knowledge on them.

I had the same thought. Some of the math looked OK -- rather basic statements of some things we know -- but there were some new terms that put those little cartoon question marks in the space over my head.

Let's wait and see.

>(I hope this doesn't turn out to be another CFA-like pursuit).

I've been hearing presentations of this stuff for 7 or 10 years now - optical tweezers.

The "vorticity" can be seen in the graphic headed "Figures at a glance":
http://www.nature.com/nphoton/journal/v5/n6/full/nphoton.2011.81.html?WT.ec_id=NPHOTON-201106#/f1

This is not to speculate about applications in the HF where energies are many, many decades down from visible light. Where light is tweezing molecules (very small ones), HF would be vastly imperceptible. It would seem this reference, then, is gratuitous - a form of authority inflation.

There are curious contradictions found:
"This novel radio technique allows the implementation of, at least in principle, an infinite number of channels on one and the same frequency, even without using polarization or dense coding techniques."
compared with:
"Already with this setup one can obtain four physically distinct channels on the same frequency by additionally introducing the use of polarization, in this case independent from OAM. A further multiplication of a factor five after the implementation of multiplexing, yields a total of 20 channels in the same frequency."

Soooo. A special vorticity technique that does not use polarization (even though they describe it as such) and does not use coding, can demonstrate novel outcomes when paired with polarization and coding (for which the outcome is fairly well established).

Why isn't this peer reviewed in EM proceedings?

Any strong laser beam will trap dust particles and pull them towards
a direction, I do not remember was it towards the light source or away
from it.
I consider that a thermal effect.

The effect is stunning when you see it the first time.
I worked as helper guy for laser shows, and we used Argon lasers

up to 30 watt output. Suddenly some bright spots aligned at the beam and slowly moved along it. Dust particles in the air, of a certain size.

The tweezing is similar to dielectrophoresis and is possibly, but not probably what you describe. In dielectrophoresis, a normally neutral molecule (water is such an example) still has an electrical dipole. The two ends add up to a neutral whole, but in the face of a non-linear electrical field, the dipole will align along the gradient and the neutral molecule can be electrostatically steered. It is a mechanism of fluidic separation done on a scale of what is called "a laboratory on chip." Panel assays (blood testing for one) are the goal.

Your 30W narrow beam could present a similar situation.

This, of course, has absolutely NOTHING to do with the claims of Vorticity.

The Vorticity effect relies on a similar news-flash that arrived here some months ago about simultaneous reception/transmission on the same frequency = very critical physical antenna geometries in a reflectionless environment.

When they distort a parabol reflector, they spread the beam.
That's what the Italian clowns forgot when publishing that picture:

http://img824.imageshack.us/img824/1558/paraboldistorted.jpg

A standard parabolic reflector would deliver a nearly parallel beam
from a source at the focus point, with a certain amount
of divergence, of course.
http://en.wikipedia.org/wiki/Parabolic_reflector

Bending the parabol out of shape causes the radio waves
go into all directions and will decrease field strength at the
receiver.

```
     |   ---------------->
    |     --------------->
   |
   |   -
   |    --
   |      --

                  -----
                         ---->
```

Their only achievement is reduction of signal quality.
The whole thing is an absolute clownerie and a mere hogwash.

w.

Always to the light "source". It is the prove of the wave model of
gravitation.

In the optical tweezers very small bodyies are attracted to the focus point.
After the focus the waves are diverging and works like the Sun.

Wave model of gravitation is proved in space and air.
S*

Dear Group: I saw a note in Science News and immediately had the feeling
that it was another scam.
73,   Mac   N8TT

"J.B. Wood" wrote in message news:j4o4im$7kk$1@ra.nrl.navy.mil...

Hello, all. I came across an article in one of my science mags in which
some researchers had discovered a method to coax more bandwidth out of a
given portion of the EM spectrum by "twisting" radio waves together.

Nothing more technical than that in the article. Well, I managed to
find one the author's papers on the subject online:

http://arxiv.org/pdf/1107.2348v2

If this technique is viable, I'm wondering why it is only now being
contemplated. Note the "twisted parabolic antenna" (Fig. 3A) on p.16.
Of course this makes me want to do some experiments in the ham bands.
(I hope this doesn't turn out to be another CFA-like pursuit).
Sincerely, and 73s from N4GGO,

Yes.. but that's usually a LONG way from where there's detectable RFI or
noise for instance. When you can see visible corona from some meters
away, you're probably in the 10s or maybe low 100s of kV range.

For instance, I can run my small 14" Van deGraaff generator with no
visible corona in a semi-darkened room, but, judging from the copious
ozone production, there's quite a bit of corona (as well as the
characteristic crackle sound).

Maybe people have seen noticeable corona at 2-3kV, but that's usually
indoors in a dark room, and you're fairly close and well dark adapted.
Corona from aged ignition wires (around 15-20 kV) also often visible, in
the dark.

Doesn't skype not support point to point? i.e. you couldn't do it from
192.168.1.10 to 192.168.1.20 on a private network. I thought skype
always needs to through the master skype resolver (to do a sort of
dynamic dns function)

  Install the remote end with your favorite operating

Yes.. of course there's that "end of life announcement" from 2004.

I suppose that if it works well enough, one can keep using it forever
(gosh, I've got plenty of software from the 90s that I keep using)

>

Yes, and they have all sorts of other features tailored for that kind of application.

All I was looking for was a "virtual audio cable" of some sort. (yes, I know that VAC is actually something else)

> If you want multiple channels of audio, better bandwidth, or have some
> exotic requirements, you'll need to supply more detail.

No, just that kind of simple thing.. send 3kHz BW audio from one PC to another, preferably with an app that is available for all 3 platforms (Win, Mac, *nix)

Something that has a command line like:

```
sendaudio -i {input audio source} -o 192.168.1.1
recvaudio -i 192.168.1.1 -o {output audio device}
```

would make me happy.

My antenna voltage gets up to about 12 kV peak.

I will try listening at a short wave receiver placed very close to the antenna and tuned to a vacant frequency slot. Increasing the transmitted carrier power, at the power level at which the corona effect has instated, I should note an abrupt received noise increase. .

Short note on change in VSWR due to corona.

Many reflectometers use diode rectifiers with relative heavy load. If there is no bias (or the bias is wrong), you will not notice small variations in VSWR, when VSWR = (almost) 1.

If you have a directional coupler you may use your oscilloscope or spectrum analyser as detector device. The oscilloscope (50 Ohms input impedance) you can use to verify if the residual VSWR is because of higher harmonics or real reflection. Of course the spectrum analyzer, oscilloscope with FFT or a receiver (with heavy attenuation) will show you the desired signal directly.

If you match to very low return signal, even a few Watts loss due to corona you can detect at full power. you may need to do this during very quiet weather as small mechanical changes due to elasticity of

the construction materials will lead to small changes in reflection
coefficient.

Simplecast.

And it's free, or used to be, if you only need 4 hours at a time. (I
own a paid for copy for use in MPLS for extended emergency rebroadcasts
of nets.) I and a ham in Maine used to use it to distribute the weekend
"432 and Above EME Net". He had minimal bandwidth, I had enough and a
Shoutcast (Icecast) server and the net was always less than 4 hours. He
connected to me as the stream input and the listeners connected to my site.

Thanks to Shoutcast allowing their system to effectively be cloned they
made solutions like mine possible. They even allow these systems to
respond as "Shoutcast" when queried.

>dynamic dns function)

True. If you're not connected to the internet, Skype will not work.

The connection needs to be established via the distributed Skype directory server system. You cannot easily bypass this to connect to any random IP address or to your isolated LAN.

If you really want to do that, perhaps a simple G.711 VoIP client would be sufficient.

>> If you want to roll your own, there's:
>> <http://www.speakfreely.org>
>
>Yes.. of course there's that "end of life announcement" from 2004.

Still works fine for me. Eventually, Microsoft will trample on some obscure function and declare anything that then fails as legacy and unsupported. Until that happens, it still works. Having the source code is also very handy. SpeakFreely has been the basis of several VoIP applications.

>I suppose that if it works well enough, one can keep using it forever
>(gosh, I've got plenty of software from the 90s that I keep using)

I'm still running a Xenix 2.3.2 server from about 1988. It should continue to function until the hard disk quits. I've been waiting for that to fail for at least 10 years.

>All I was looking for was a "virtual audio cable" of some sort. (yes, I
>know that VAC is actually something else)

Virtue and virtual are their own punishments.

>No, just that kind of simple thing.. send 3kHz BW audio from one PC to
>another, preferably with an app that is available for all 3 platforms
>(Win, Mac, *nix)
>
>Something that has a command line like:

```
>sendaudio -i {input audio source} -o 192.168.1.1
>recvaudio -i 192.168.1.1 -o {output audio device}
```

VLC will encode via an RTSP (real time streaming protocol) container using RTP (real time transport protocol).

This looks like the magic incantations:
<http://wiki.videolan.org/Documentation:Streaming_HowTo/Command_Line_Examples#RTSP_live_streaming>

Server:

```
>>  % vlc -vvv input_stream --sout '#rtp{dst=192.168.0.12,port=1234,sdp=rtsp://
server.example.org:8080/test.sdp}'
```

client:

```
>>  % vlc rtsp://server.example.org:8080/test.sdp
```

More:

<http://wiki.videolan.org/Documentation:Streaming_HowTo/
Advanced_Streaming_Using_the_Command_Line>
<http://wiki.videolan.org/Documentation:Streaming_HowTo/Command_Line_Examples>

Watch out for the screaming media features versus OS list.:
<http://www.videolan.org/streaming-features.html>

I must admit that I've never tried using VLC for encoding. If I have
time, I'll give it a try. Otherwise, good luck.

If I were to hazard a guess, this sounds like another holy grail dream
for the digital folks. Many who just inherently "know" that bandwidth is
infinite and can support infinite data.

Imagine - the entire universe playing Angry Birds at the same time. The
mind boggles!

Just acquired a couple reels of electric-fence wire from someone who got
smart and got rid of her horses. Question: is this wire (seems to be
aluminum) useful for antenna applications?

I have used IHU, http://ihu.sourceforge.net/ for voip streaming. It's
for Linux and that maybe disqualfies that program?

Lots of things are sold as "electric fence wire" in this part of the world.

One of them is a 2.7mm diameter aluminium wire with a HT steel core. The aluminium is sufficiently thick that it is a ver good antenna wire, it is strong and has effective RF resistance not much higher than copper.

On the other hand, we can buy HT steel wire with a flash of Zal (Zinc-Aluminium) plating coated then with polyeurathane. Makes an appalling conductor for low HF.

You will need to take the effort to better describe your own wire to get a worthwhile opinion.

Owen

It's solid and uncoated- no core. Looks like aluminum (I've worked with
stainless steel wire and this wire ain't steel). Quite flexible. And the
price was right. :)

I would think that if it's strong enough to hold up it's own weight (plus a little more) then it should certainly be usable for an antenna. Making connections to aluminum isn't exactly easy at times, but can certainly be done. I've used the coated-steel type electric fence wire, the hardest part about using it was the mechanical aspects. It loves to kink. The best antenna wire is whatever you happen to have enough of at the time, right??

"Appalling conductor"? How so? In radio school they tell us a wet piece
of rope can be used in an emergency; where does that land on the
"appalling" scale?

They sell aluminum grounding blocks at the hardware store, basically
aluminum bars with screw threads every half inch or so. These are cheap
and easily broken into usable splicing blocks, using a hammer and a vise.

I use these for mid-air splices on my loops, and for the radial system
for my verticals. Again, remove the screws, break as needed (remember
Cinch Jones barrier strips?), good DX!
